Bats of Connecticut

Big Brown Bat, Newgate 2011

Cave Hibernating

Big Brown Bat (*Eptesicus fuscus*)

Little Brown Bat (*Myotis lucifigus*)

Northern Long-eared Bat (*Myotis septentrionalis*)

Tri-colored Bat (*Perimyotis subflavus*)

Eastern small-footed Bat (*Myotis leibii*)

Indiana Bat (*Myotis sodalis*)

Tree Roosting (migratory)

Silver-haired Bat (*Lasionycteris noctivagans*)

Eastern Red Bat (*Lasiurus borealis*)

Hoary Bat (*Lasiurus cinereus*)

Paul Fusco

White-nose Syndrome

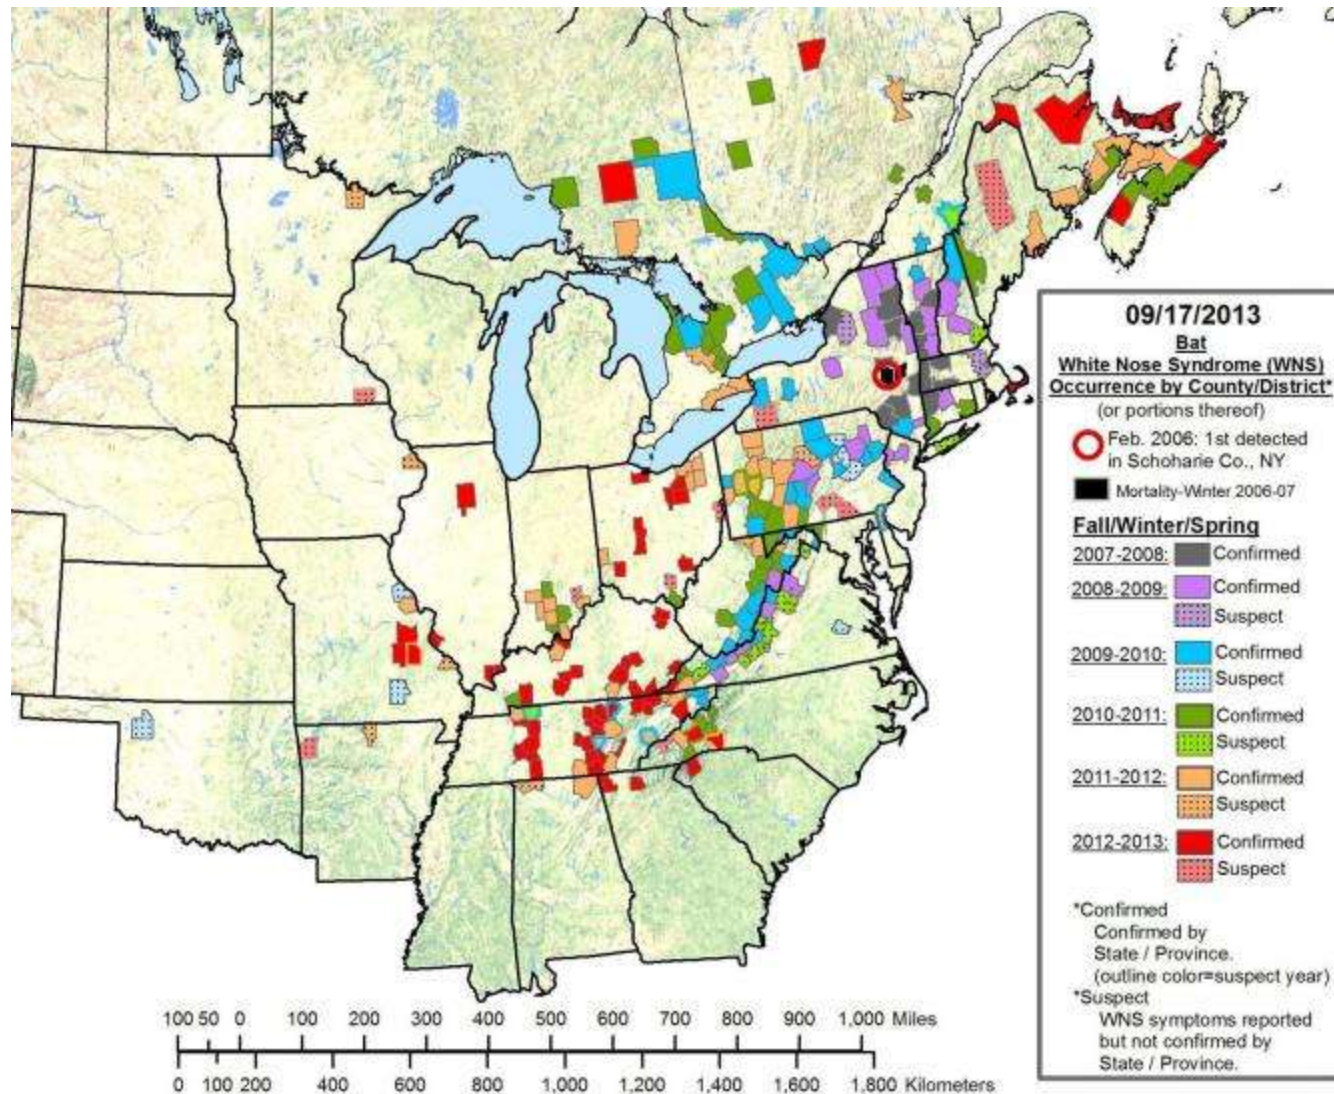

Photo: Al Hicks, NY DEC

- Cold-loving fungus: *Pseudogymnoascus destructans*
- Epidermal infection of the muzzle and wings
- Affects cave hibernating bats
- 90-100 % mortality depending on spp and region
- Nearly 6 million bats have died as a result of WNS (USFWS, Jan 2012)

Photo: Nancy Heaslip, Hailes Cave 3/14/2007

Distribution of WNS in North America

Benefits of Acoustic Monitoring

- Non-invasive, hands-off monitoring
- Casts a bigger “net”
- No threat of spreading WNS
- Enables driving transects for broader geographic coverage

Image from Joe Szewczak

Echolocation

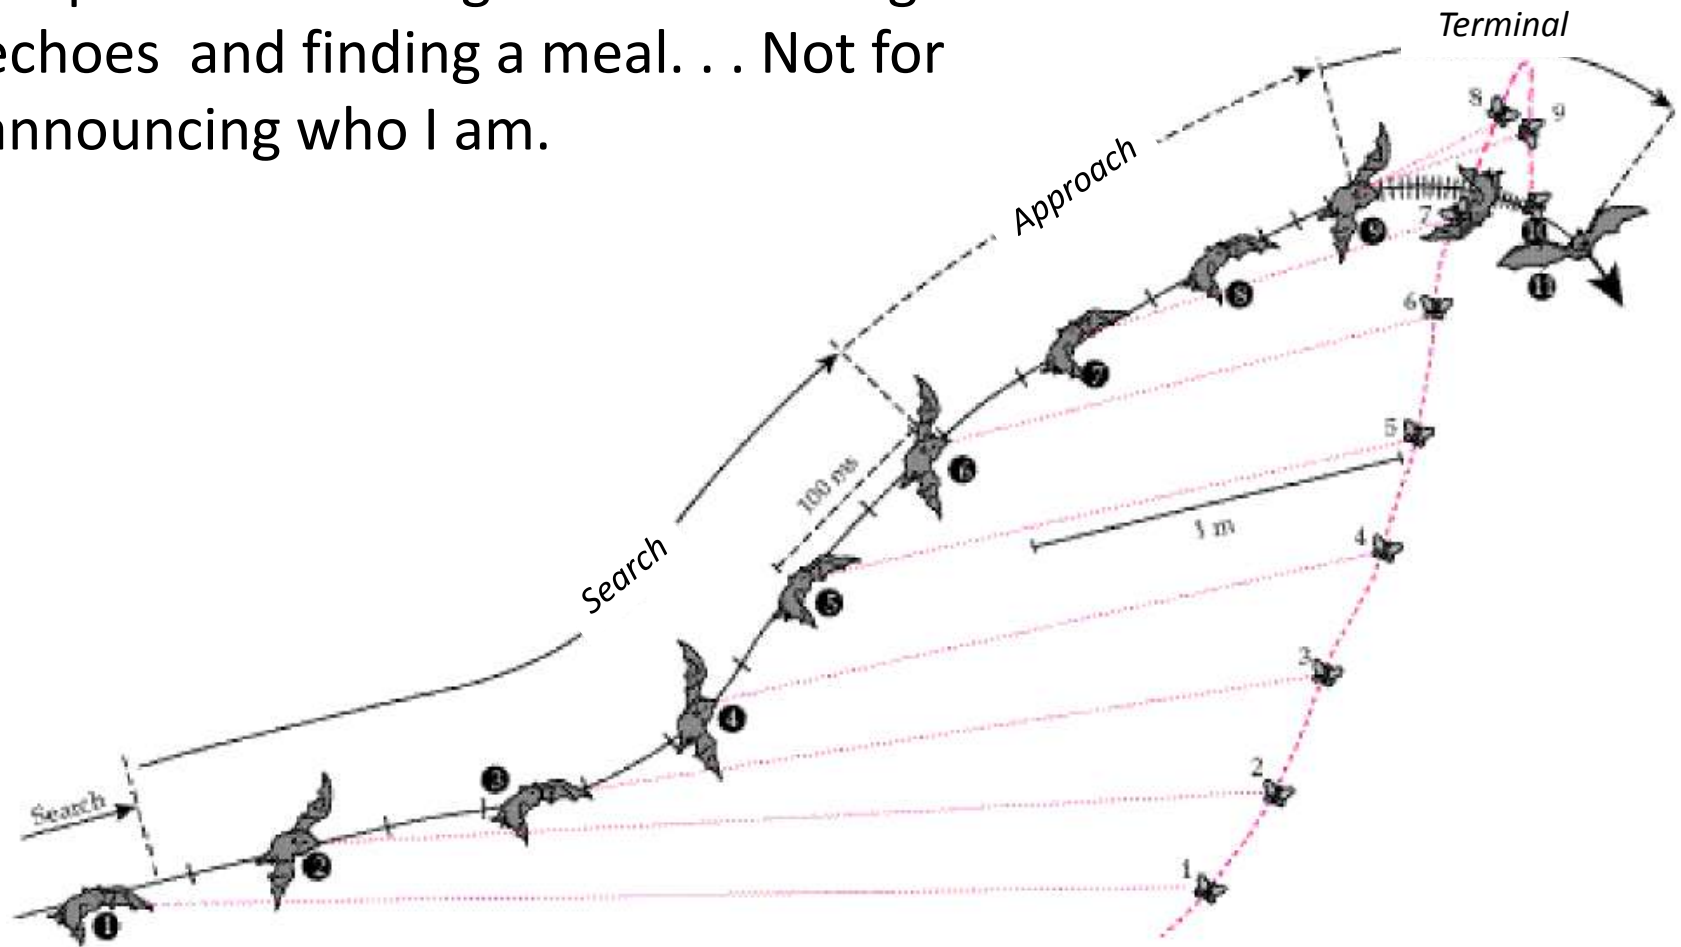

- Ultrasonic vocalizations used to forage for insects.
- Sophisticated sensory system analyzes the returning echoes.

- Distance
- Size
- Velocity
- Direction
- Flutter
- Texture

Virginia Big-eared Bat

Foraging vocalizations are for the purpose of listening to the returning echoes and finding a meal. . . Not for announcing who I am.

Acoustic Monitoring Routes in Connecticut

Nine ~20-mile routes surveyed twice per month from May – October
108 surveys per year with thousands of recordings made.

Hardware

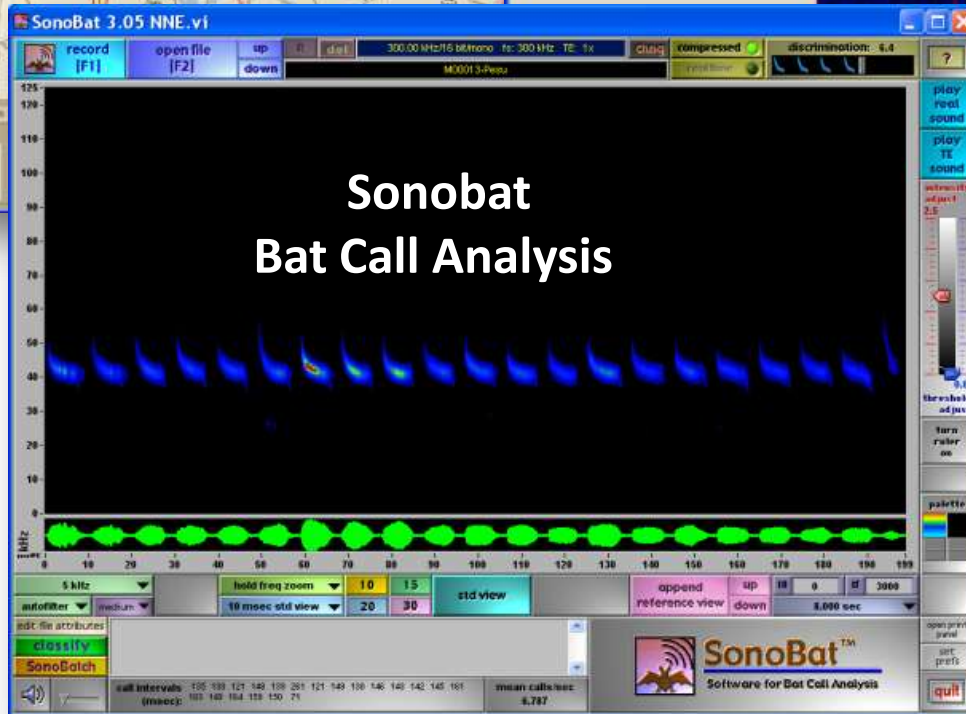

- Binary Acoustics AR 125 bat detector in PVC housing
- Inexpensive GPS unit

Software

Full spectrum call recording and analysis

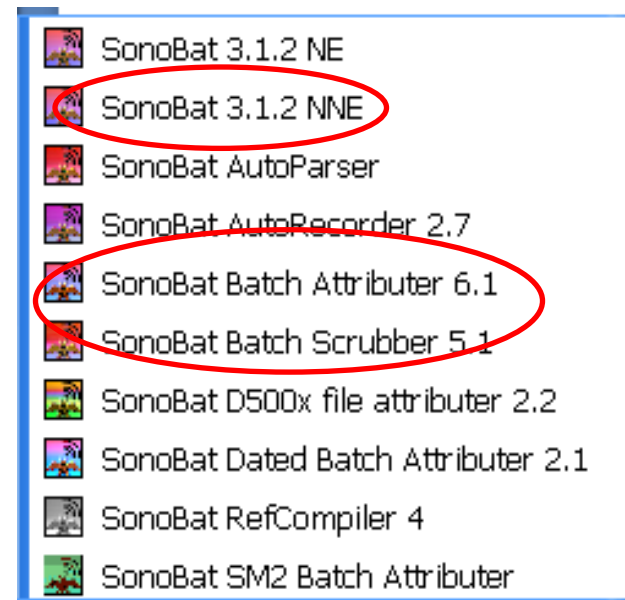

Nocturnal Volunteers

Suite of utilities supporting multiple detectors.

- Regional versions
- Accepts full spectrum data
- File attributer
- Data scrubbing
- Species classification
- Batch processing
- Reference call library

SonoBatTM

Software for bat Call Analysis

Licensed to: State of CT Environmental Protection

SonoBat for the US North Northeast and Ontario region v3.1

The species decisions generated by SonoBat should be considered as suggested classifications. Any final conclusions regarding species presence should be confirmed by a qualified biologist with knowledge of bat echolocation call characteristics and the limitations imposed by species having similar call characteristics. Although some species have distinctive call types that facilitate confident identification, other species exhibit many overlapping call characteristics that reduce the reliability of using bat echolocation calls as a sole indicator of presence. In some instances irrefutable species confirmation may require a "bat in hand."

The SonoBat automated species classification algorithms are based upon several thousand species-known recordings (sample size varies from species to species) from specific sites within each geographic region covered. While derived from a robust data set acquired from a variety of environments and conditions, the data set nevertheless encompasses a finite set of vocalizations from each species covered and can not fully represent the repertoire of bat vocalizations. Bats exhibit considerable plasticity in their vocalizations, and considerable overlap in call parameters among species; this coupled with complications from noise and weak signals (as from bats at a greater distance from the detector) can potentially result in a recording from one species exhibiting parameters that match the expected parameter space of another species, resulting in a misclassification. For example the simple call shapes of shorter *Eptesicus fuscus* and *Lasiurus noctivagans* may present calls that overlap in data space with sufficient ambiguity to result in misclassification. Follow the rubric on the acoustic characteristic table for vetting shorter calls of these species. The longer curved

Understand the limitations of species classifications.

Some species have overlapping call characteristics that can be misleading.

Epfu/Lano

Bat Population Data (BPD) Project[BPD Home](#)[Data](#)[Bibliography](#)[Species List](#)[Search](#)

COMING SOON!! The North American Bat Monitoring Program (or NABat)!!!

Despite their importance and the many threats facing their populations [e.g., white-nose syndrome (WNS), climate change, wind energy development, and habitat loss and fragmentation], there are currently no national programs to monitor and track bat populations in North America. A statistically rigorous and nationally coordinated bat monitoring program is critical for determining the impacts of the many stressors on bat populations, as well as for determining the efficacy of management actions taken to conserve bat populations (i.e., adaptive management).

The objectives of NABat are to: 1) provide the architecture for coordinated bat monitoring to support local, regional and range-wide inferences about trends in bat populations and abundances in response to WNS, climate, wind energy, and habitat loss, and 2) provide managers and policy makers with the information they need on bat population trends to effectively manage bat populations, detect early warning signs of population declines, and estimate extinction risk. Workshops are being held to develop the monitoring program in 2013 and 2014. A small group of statisticians (12-15) with expertise in large-scale monitoring designs and bat biologists will participate in these workshops with the goal of developing a national bat monitoring protocol.

The workshops will have scientists and researchers from multiple agencies including USFWS, USGS, U.S. Forest Service, National Park Service, the University of Calgary, the Canadian Wildlife Service, and the University of Tennessee, National Institute of Mathematical and Biological Synthesis. There will also be international representation from Canada, Mexico, and the United Kingdom to present their views on national monitoring programs.

STAY TUNED!!!
