

# Understanding Connecticut's Black Bears through Non-Invasive Hair Sampling

Michael Evans

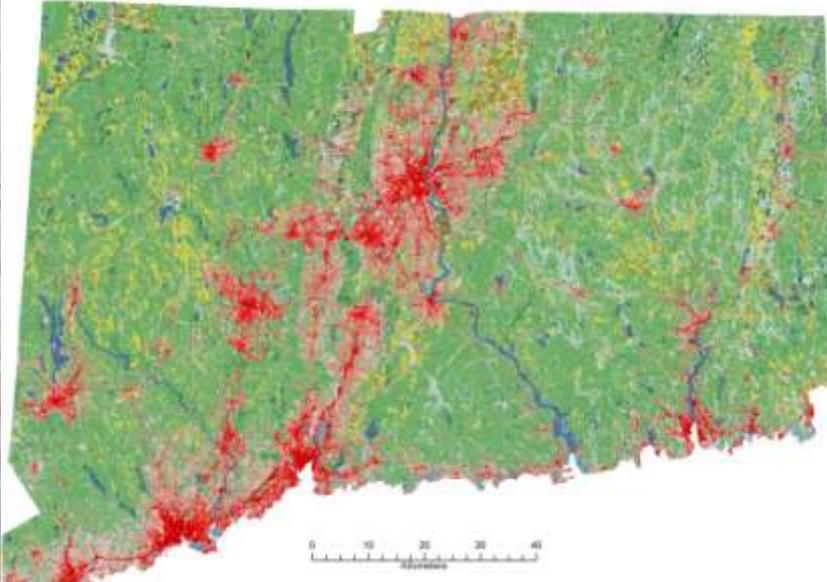

# Black Bear in Connecticut

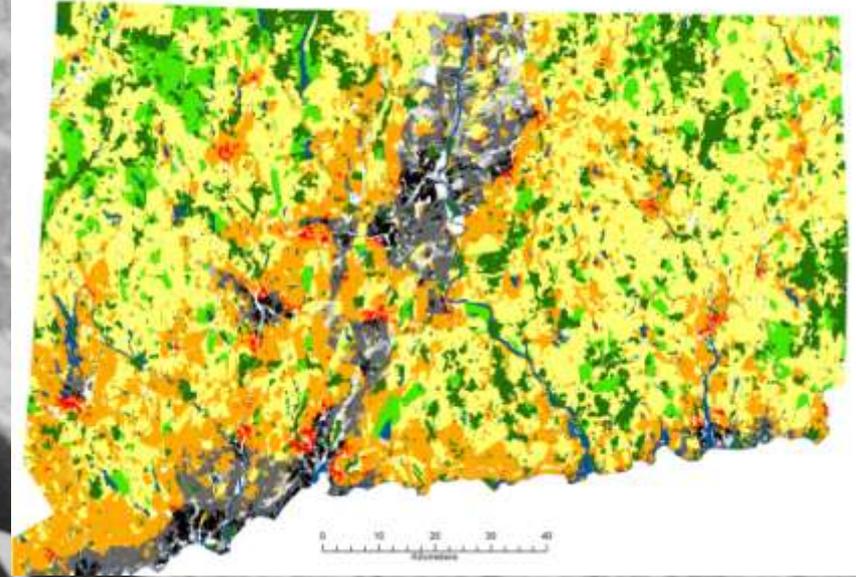

Sightings reports from 2011 Provided by CT DEEP

# Connecticut's "Exurban" Landscape

~ 60% Forested Land Cover

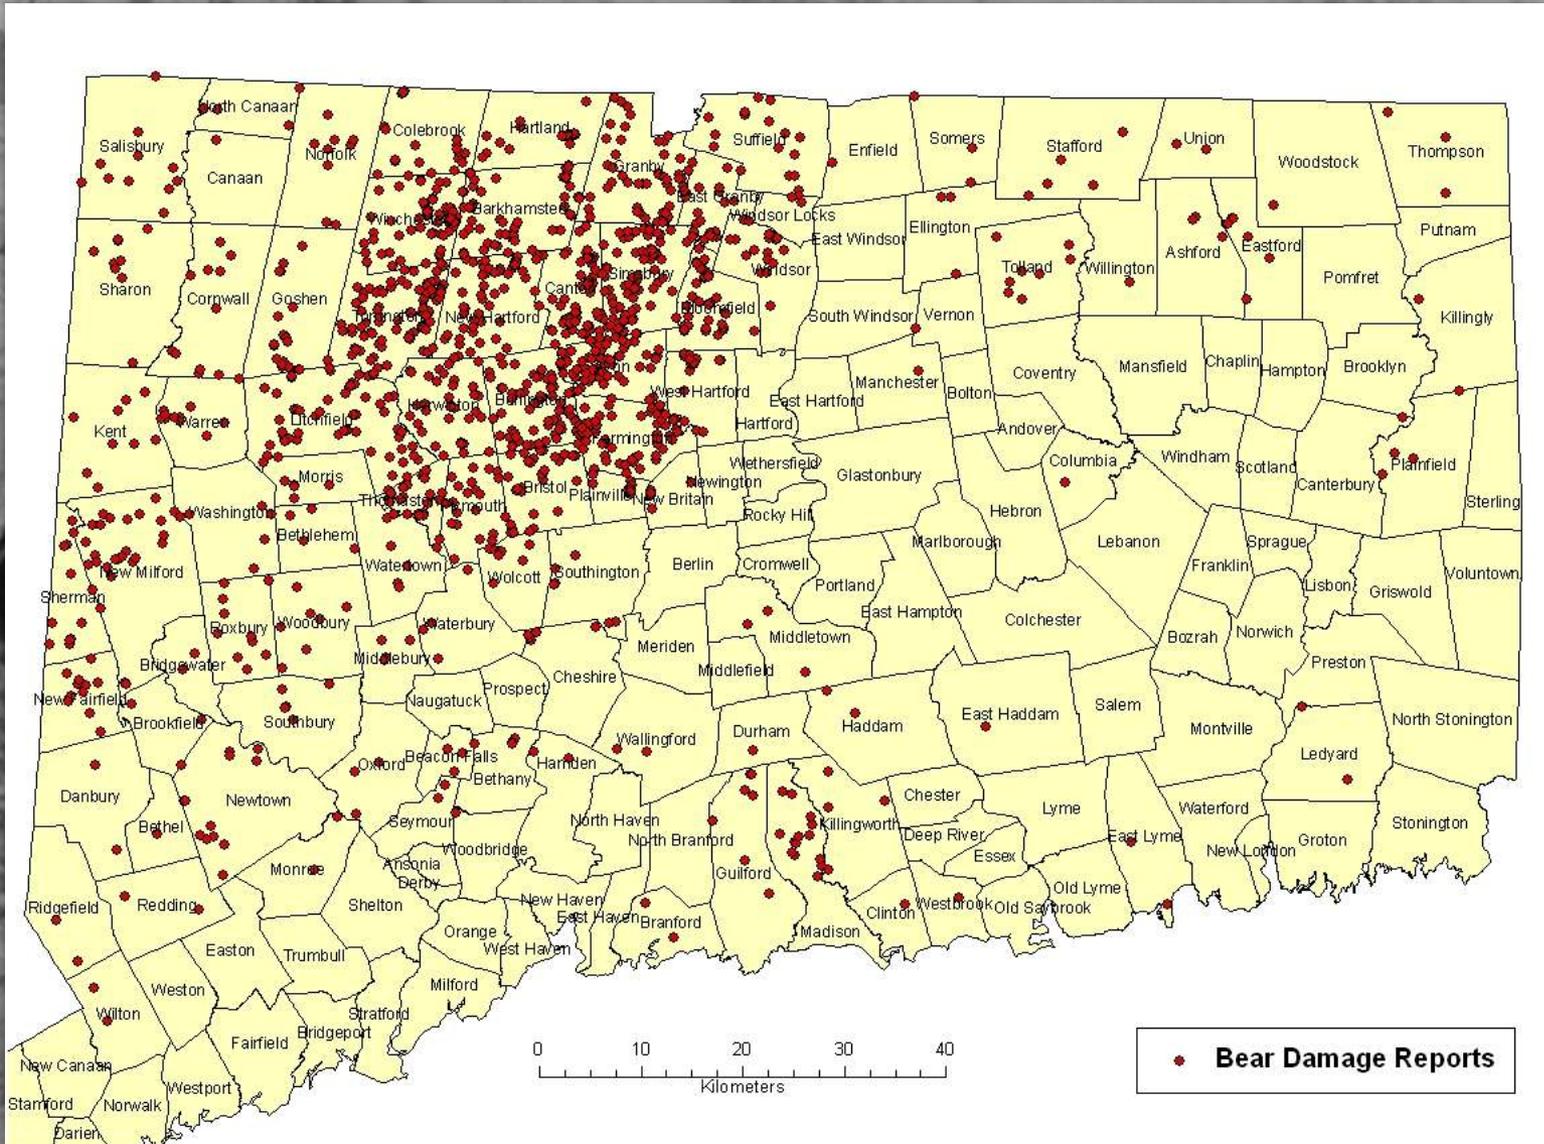

> 50% 'Intermixed' Land Use

Intermixed housing and forest

1. Promotes human-bear interactions
2. May affect bear biology and behavior

# Bear Damage Reports (2008 – 2012)

# Effects of Human Development on Black Bear Ecology in Connecticut

**Pattern**

**Process**

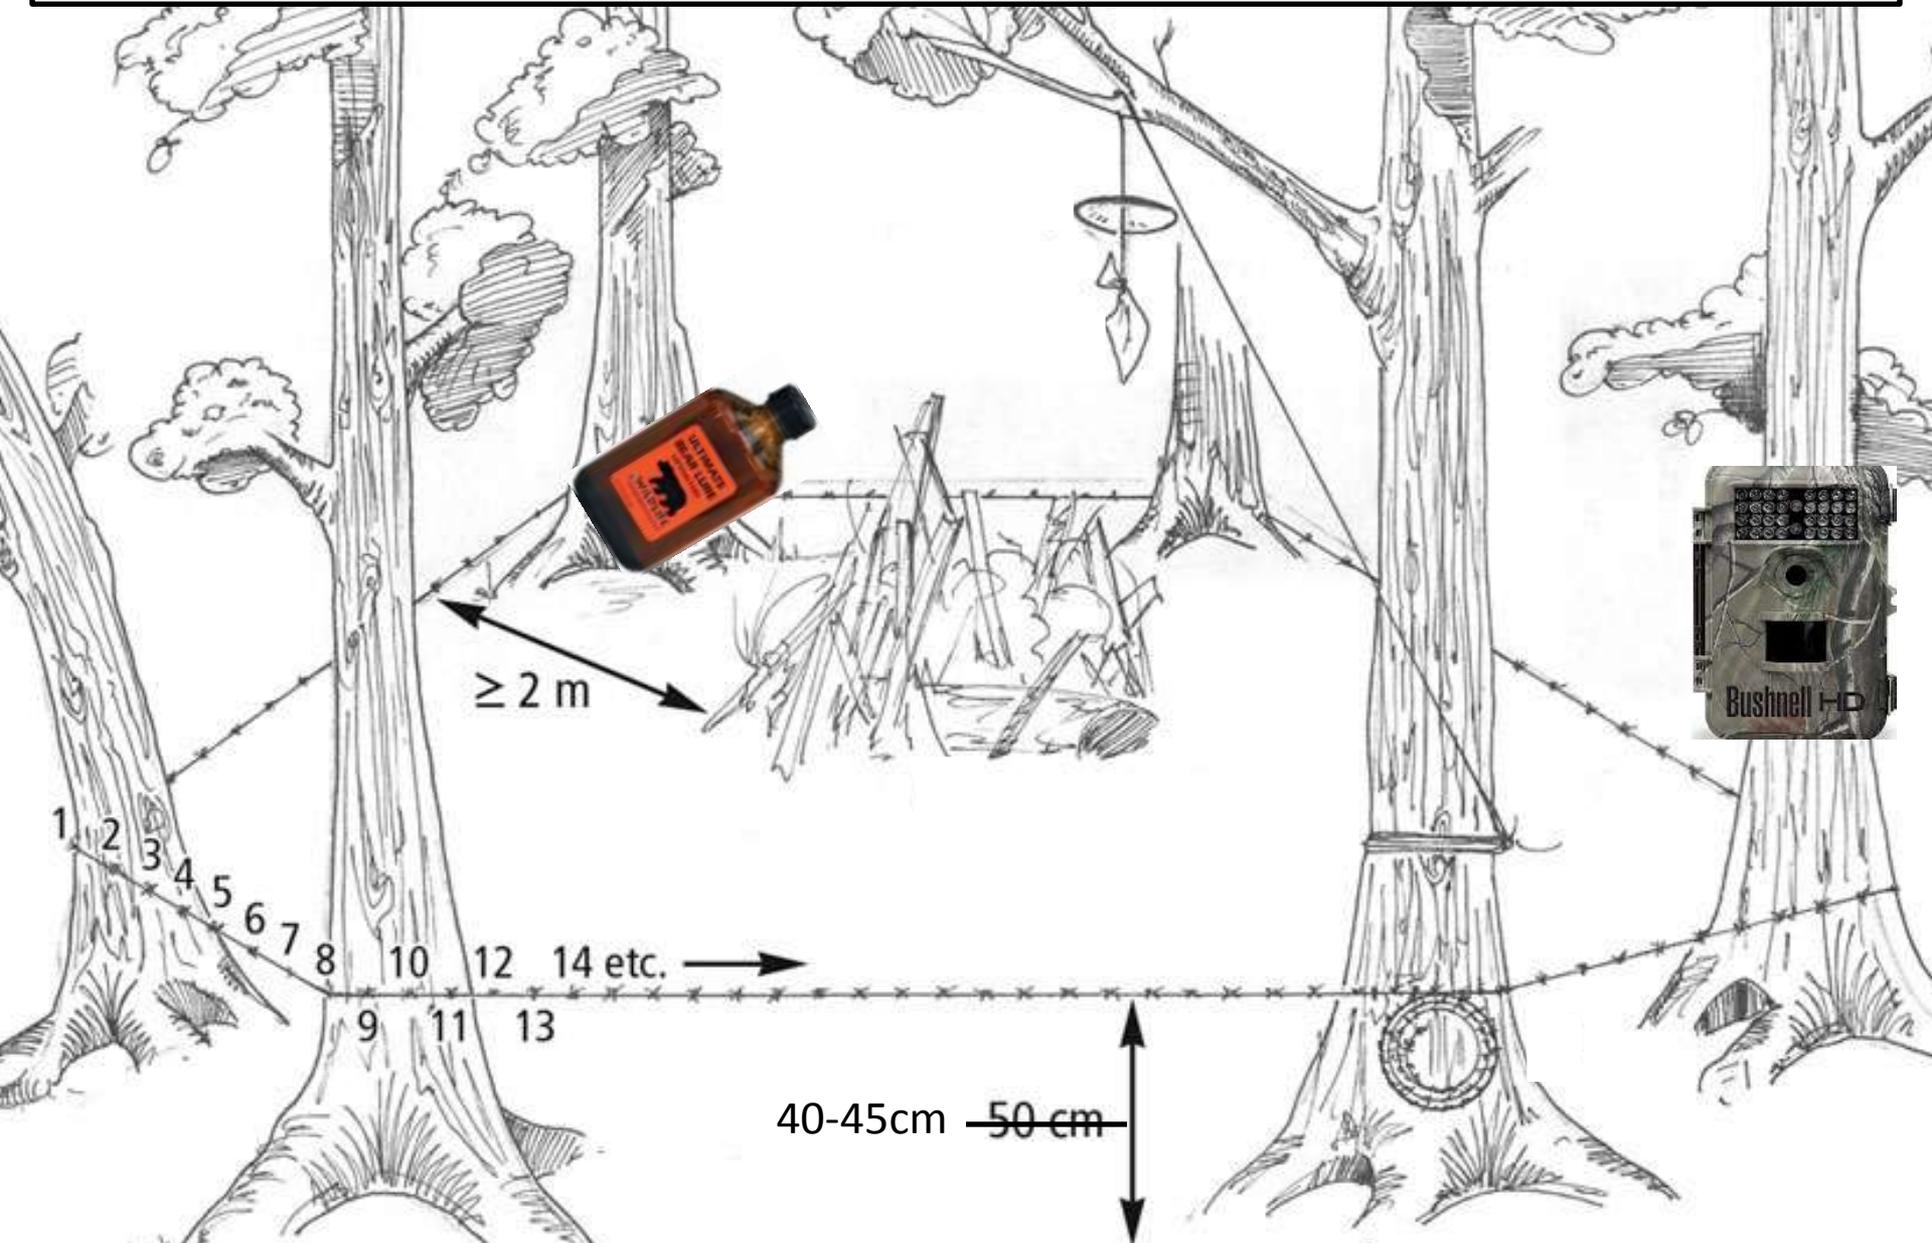

## Population Structure

1. Abundance & Density
2. Distribution

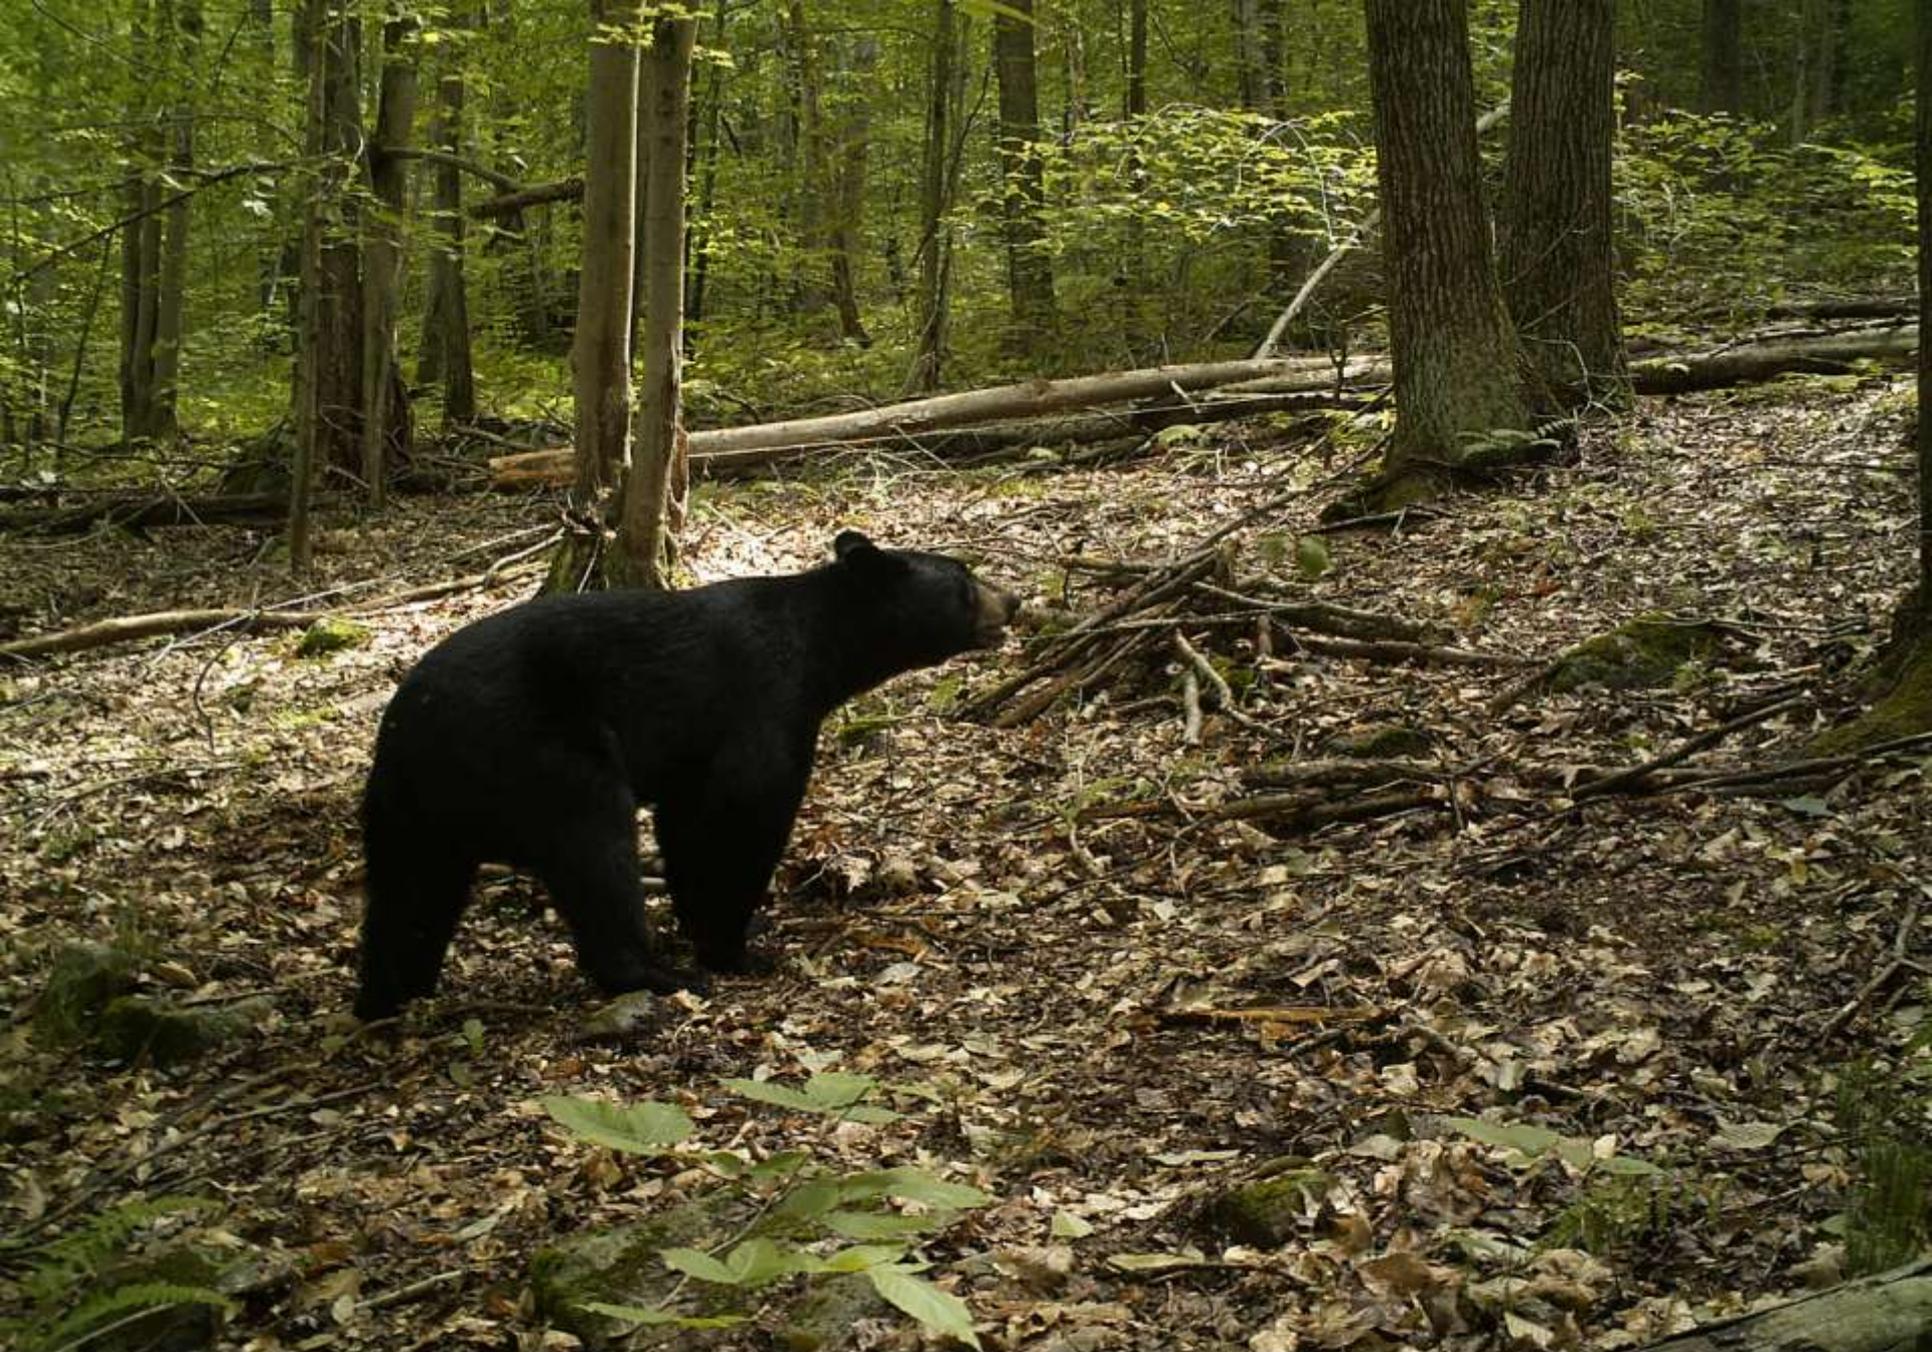

## Behavior

1. Dispersal
2. Resource Selection
3. Home Range Structure

# Non-Invasive Hair Sampling

Credit: Stephen Harrison, from Noninvasive Survey Methods for Carnivores (2008)

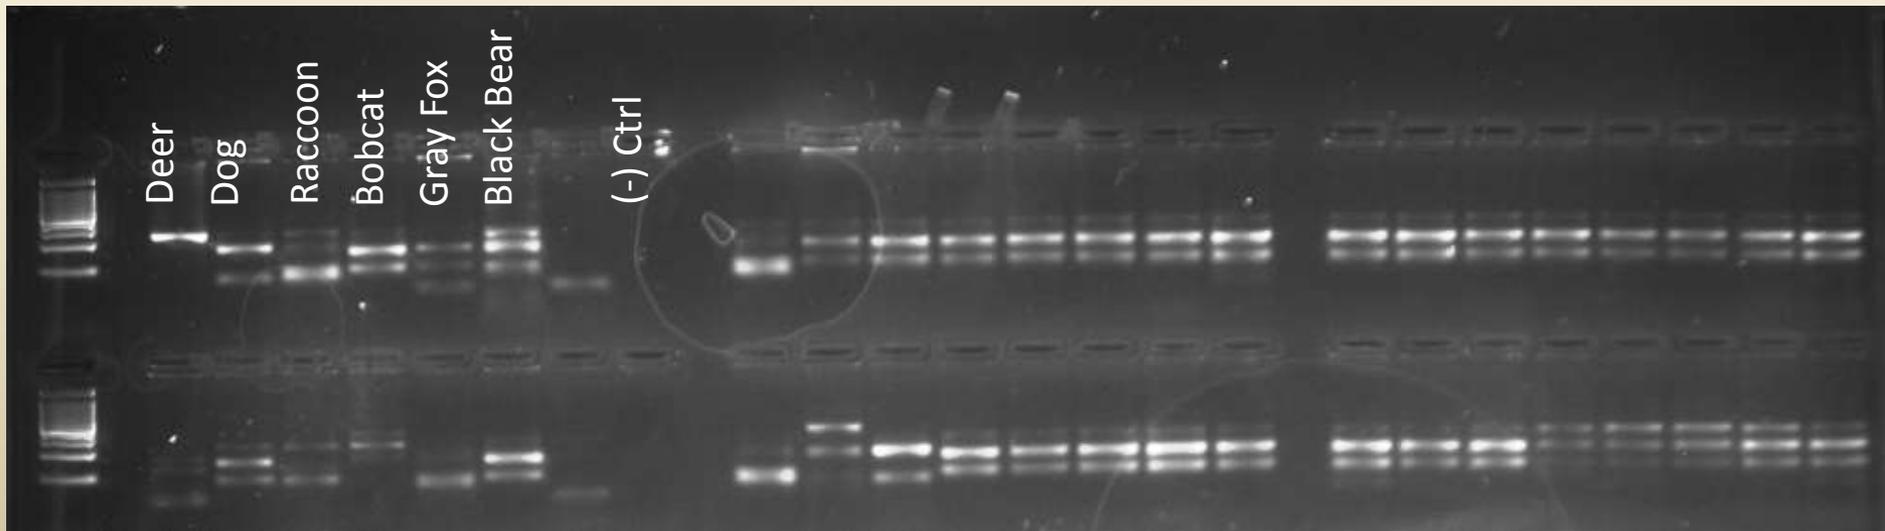

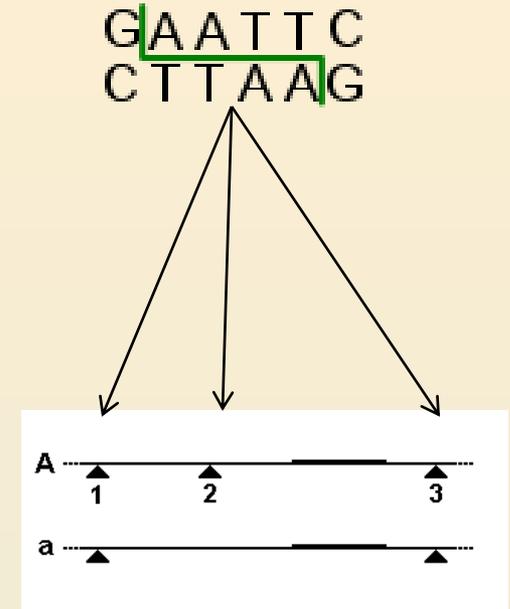

# What's In A Hair?

1. Individual identity
2. Relationship to other bears
3. Dietary composition

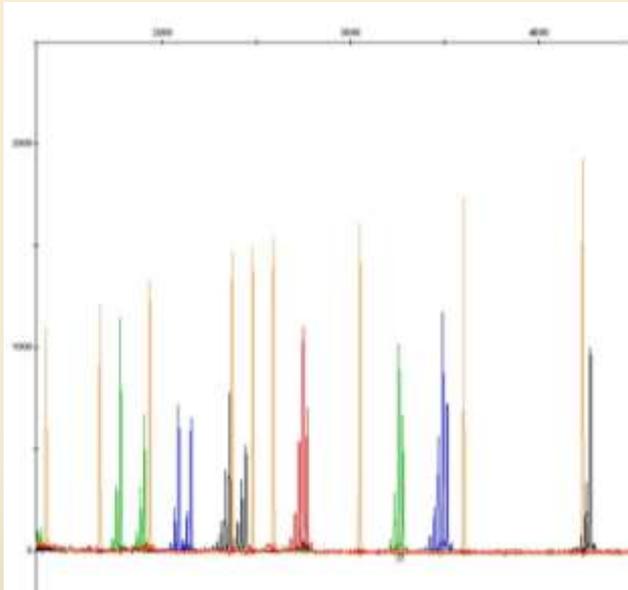

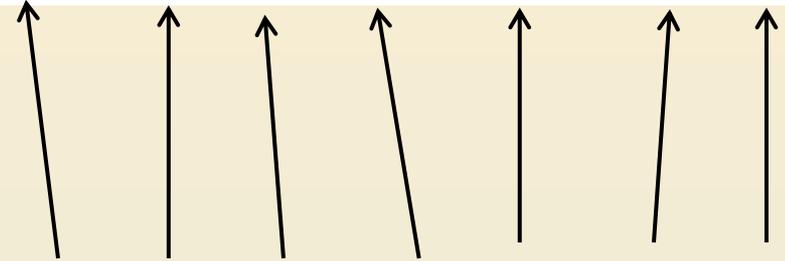

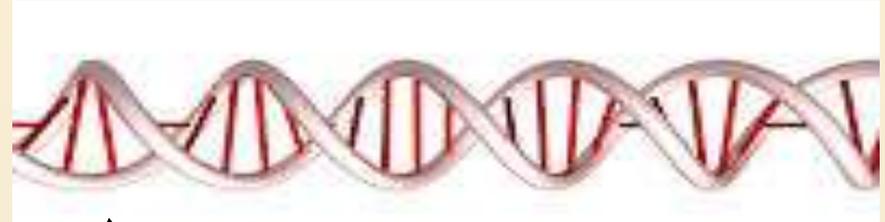

# Species Identification

1. **Restriction enzyme digests**
2. Sequence at highly conserved loci

# Unique Genotypes – genetic ‘fingerprints’

1. Individual ID
2. Relationships

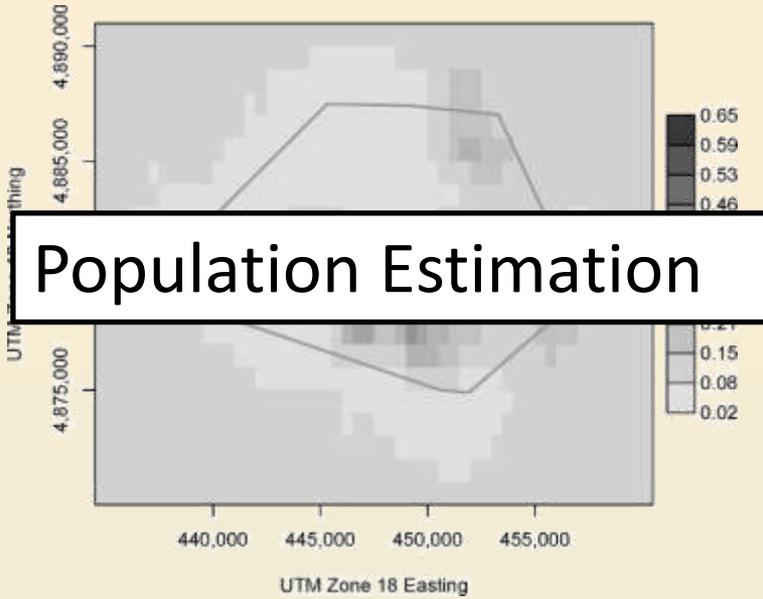

SAMPLE	G10C	G10M	G1A	G10B	G1D	G10L	G10P
BEAR #1	114	200	113	161	130	125	163
	114	200	117	165	130	125	173
BEAR #2	114	200	113	161	130	121	163
	114	202	115	165	130	125	173

Probability of identity (

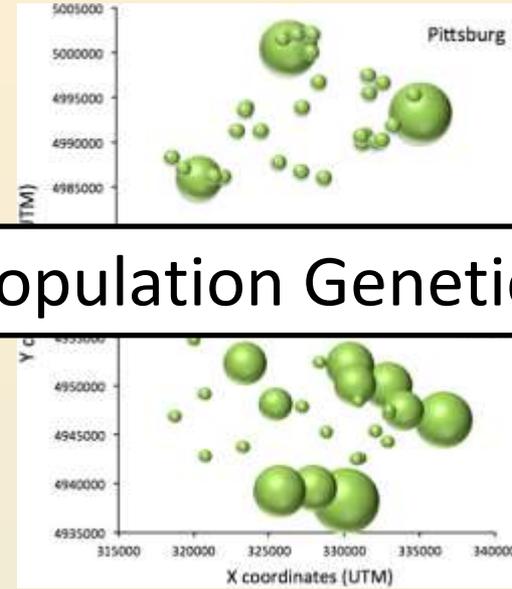

$$P_{(ID)} = \sum p_i^4 + \sum \sum (2p_i p_j)^2$$

# Applications

## Population Estimation

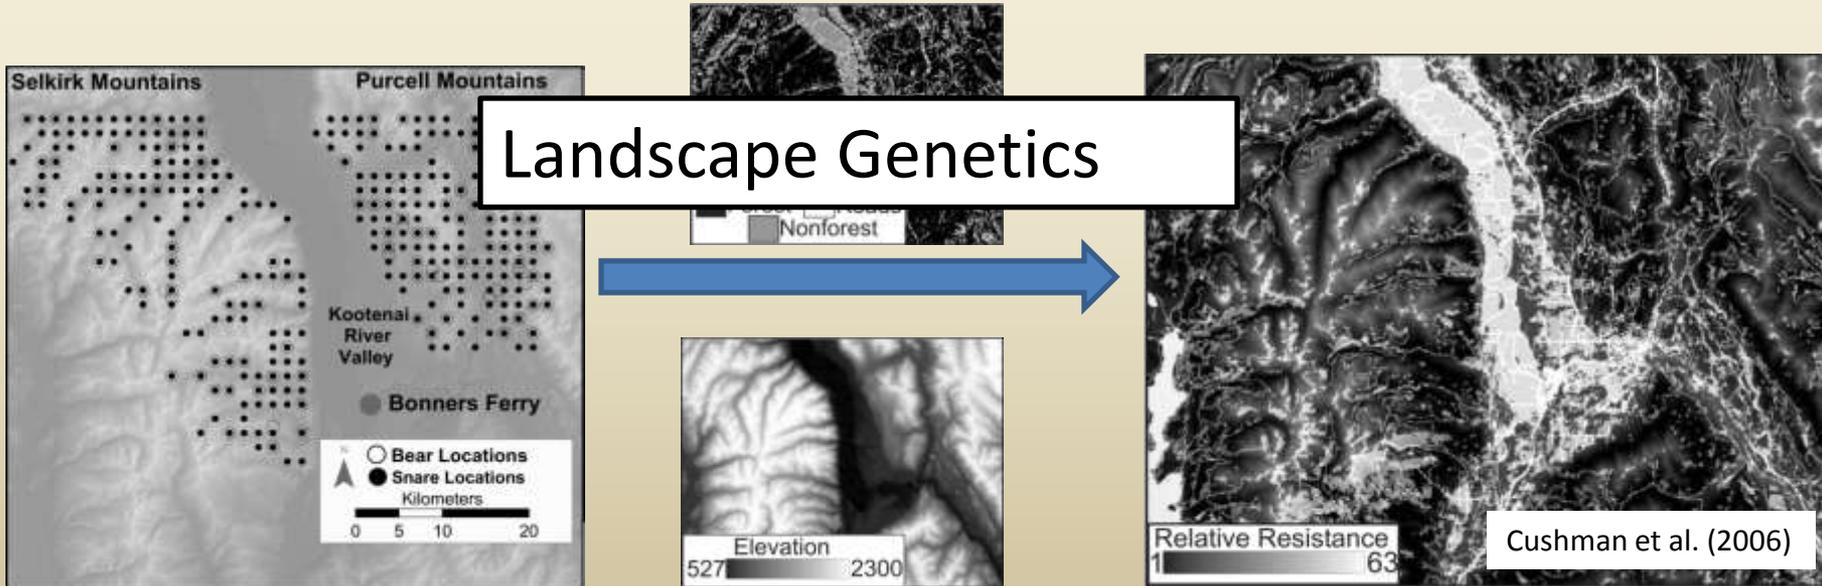

## Population Genetics

Coster et al. (2010)

## Landscape Genetics

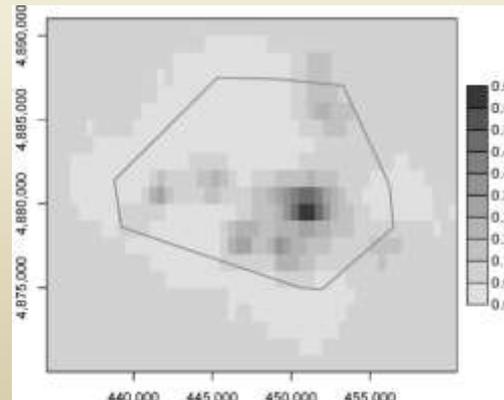

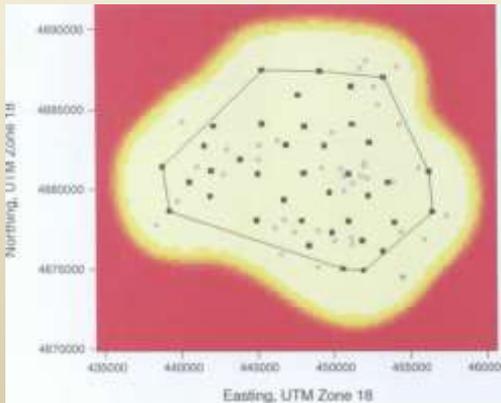

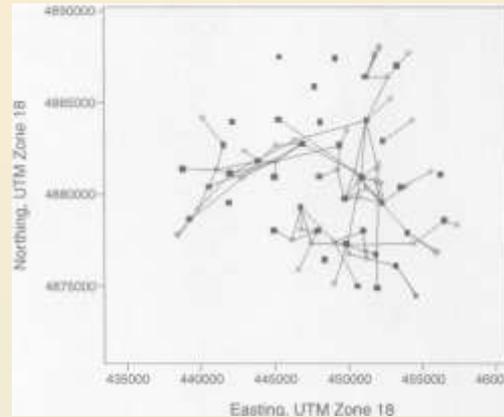

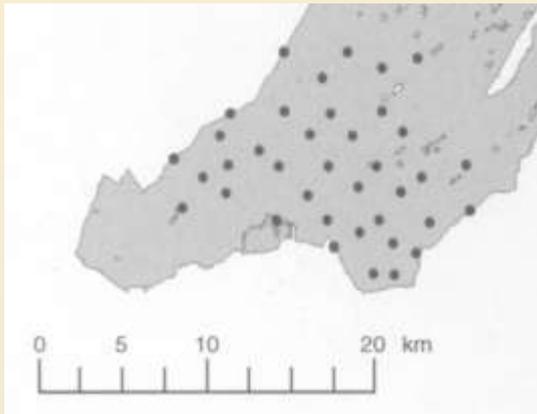

# Spatial Mark-Recapture

$$\Pr(y_{ijk} = 1) = 1 - \exp(-\lambda_0 g_{ij})$$

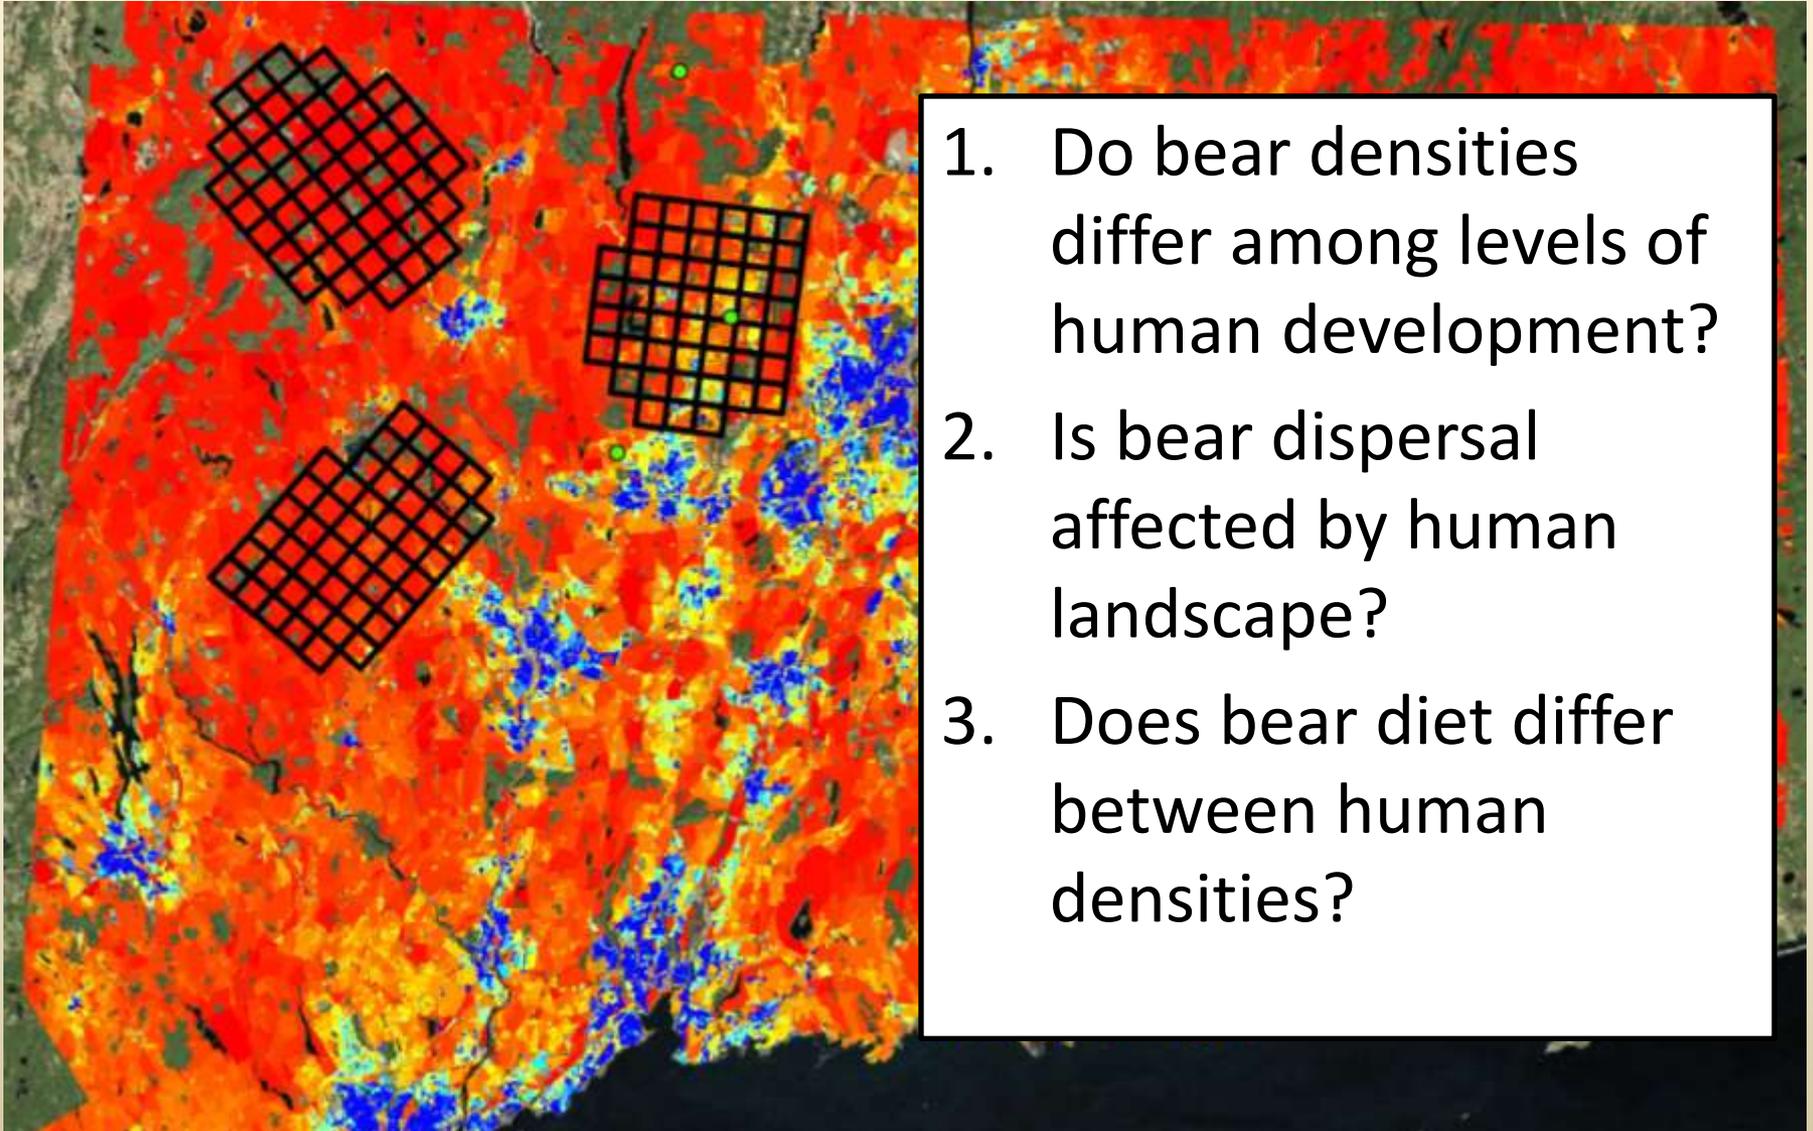

$$g_{ij} = \exp\left(\frac{-d_{ij}^2}{\sigma^2}\right)$$

Incorporates capture heterogeneity as fcn of relative location

Explicitly defined, inherent estimation of effective sampling area

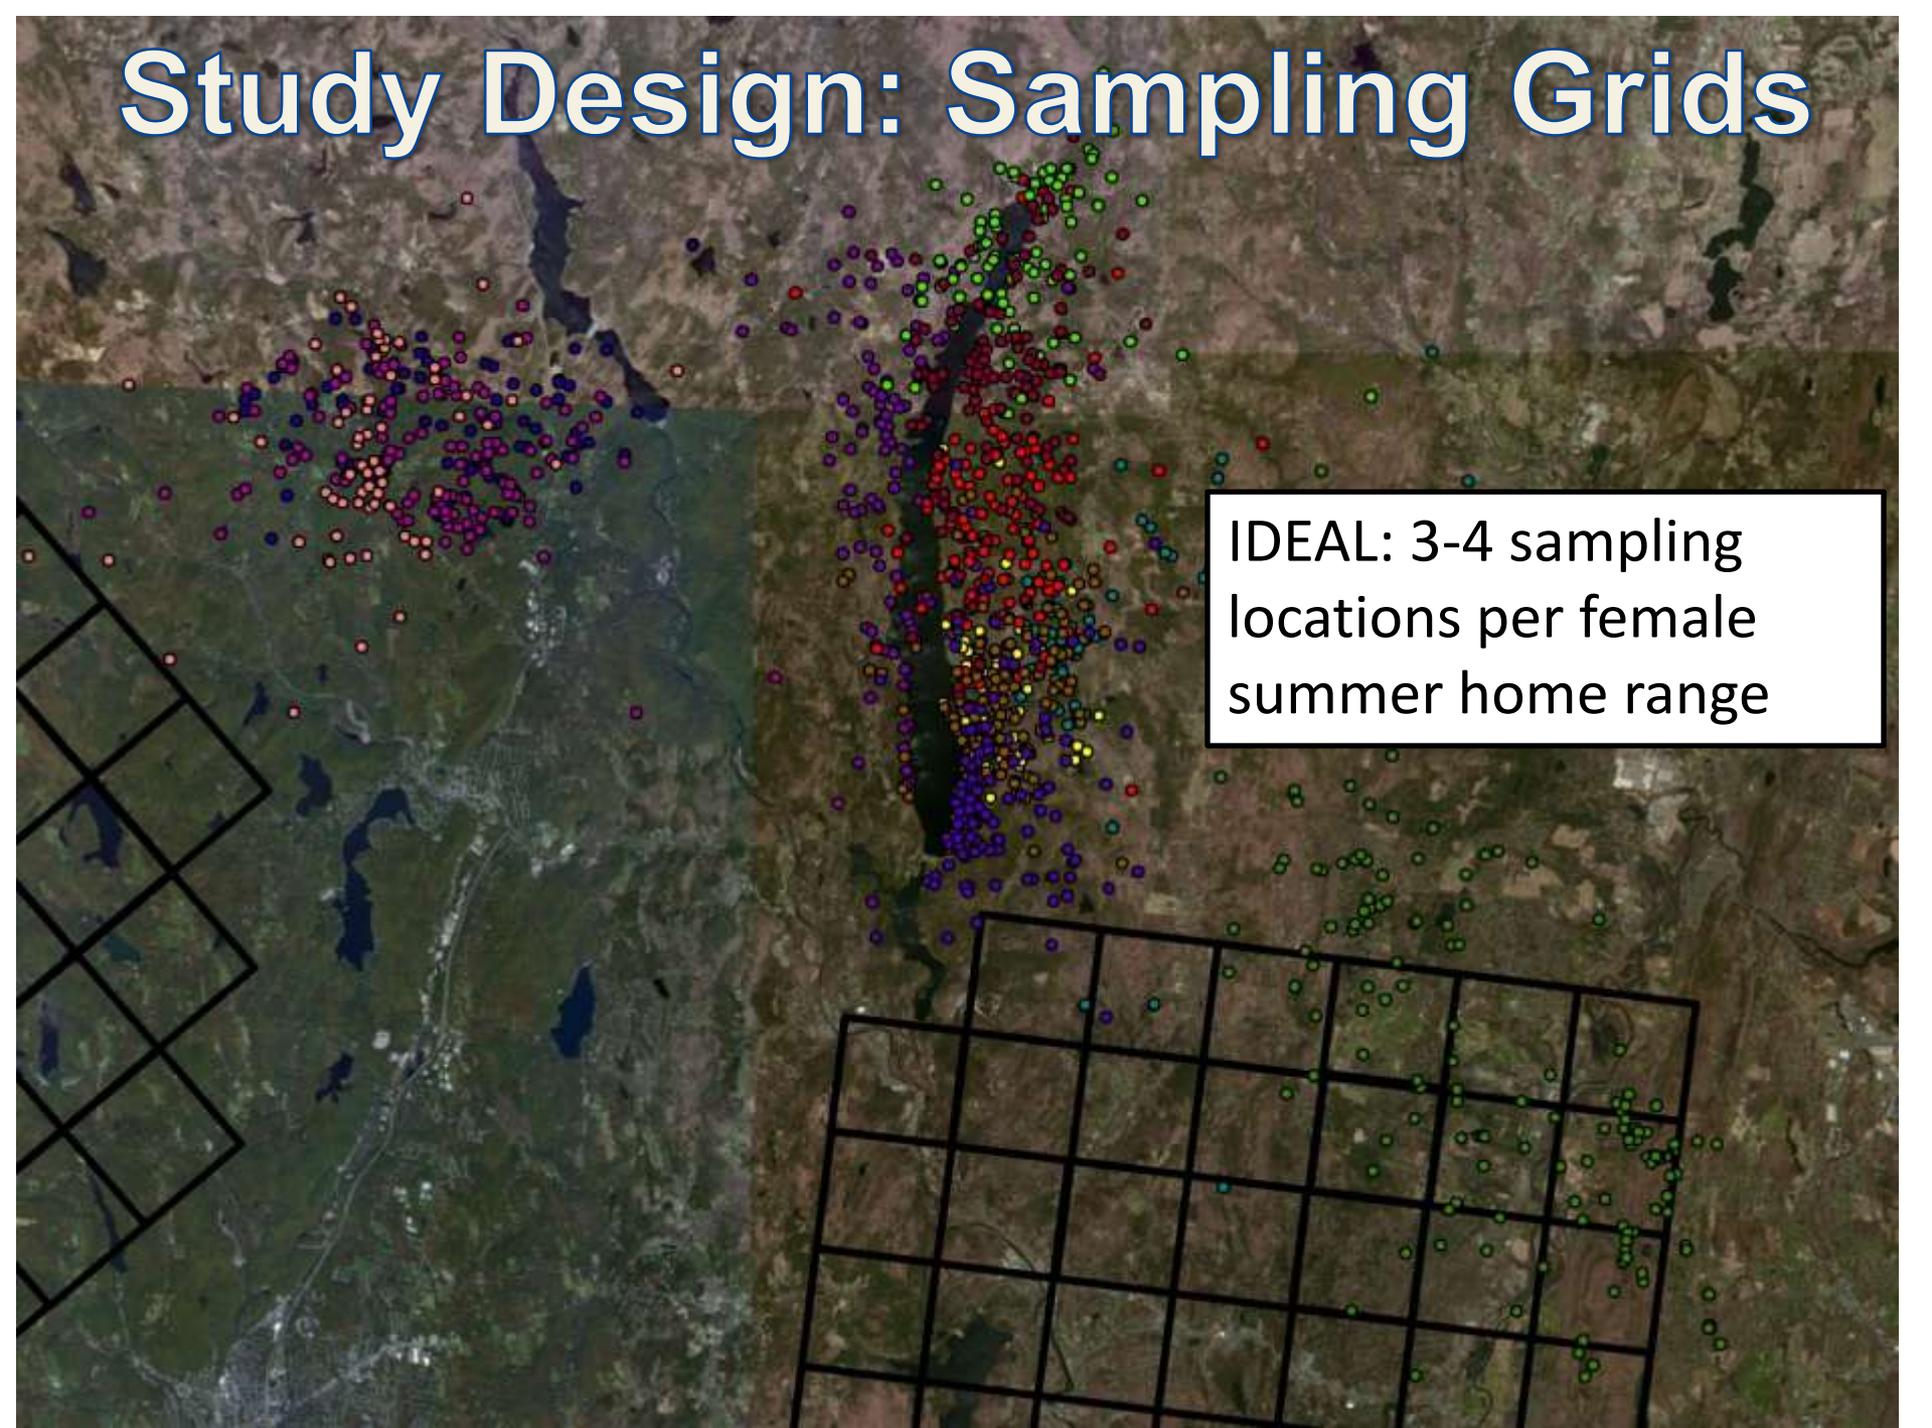

# Additional Research Questions

1. Do bear densities differ among levels of human development?
2. Is bear dispersal affected by human landscape?
3. Does bear diet differ between human densities?

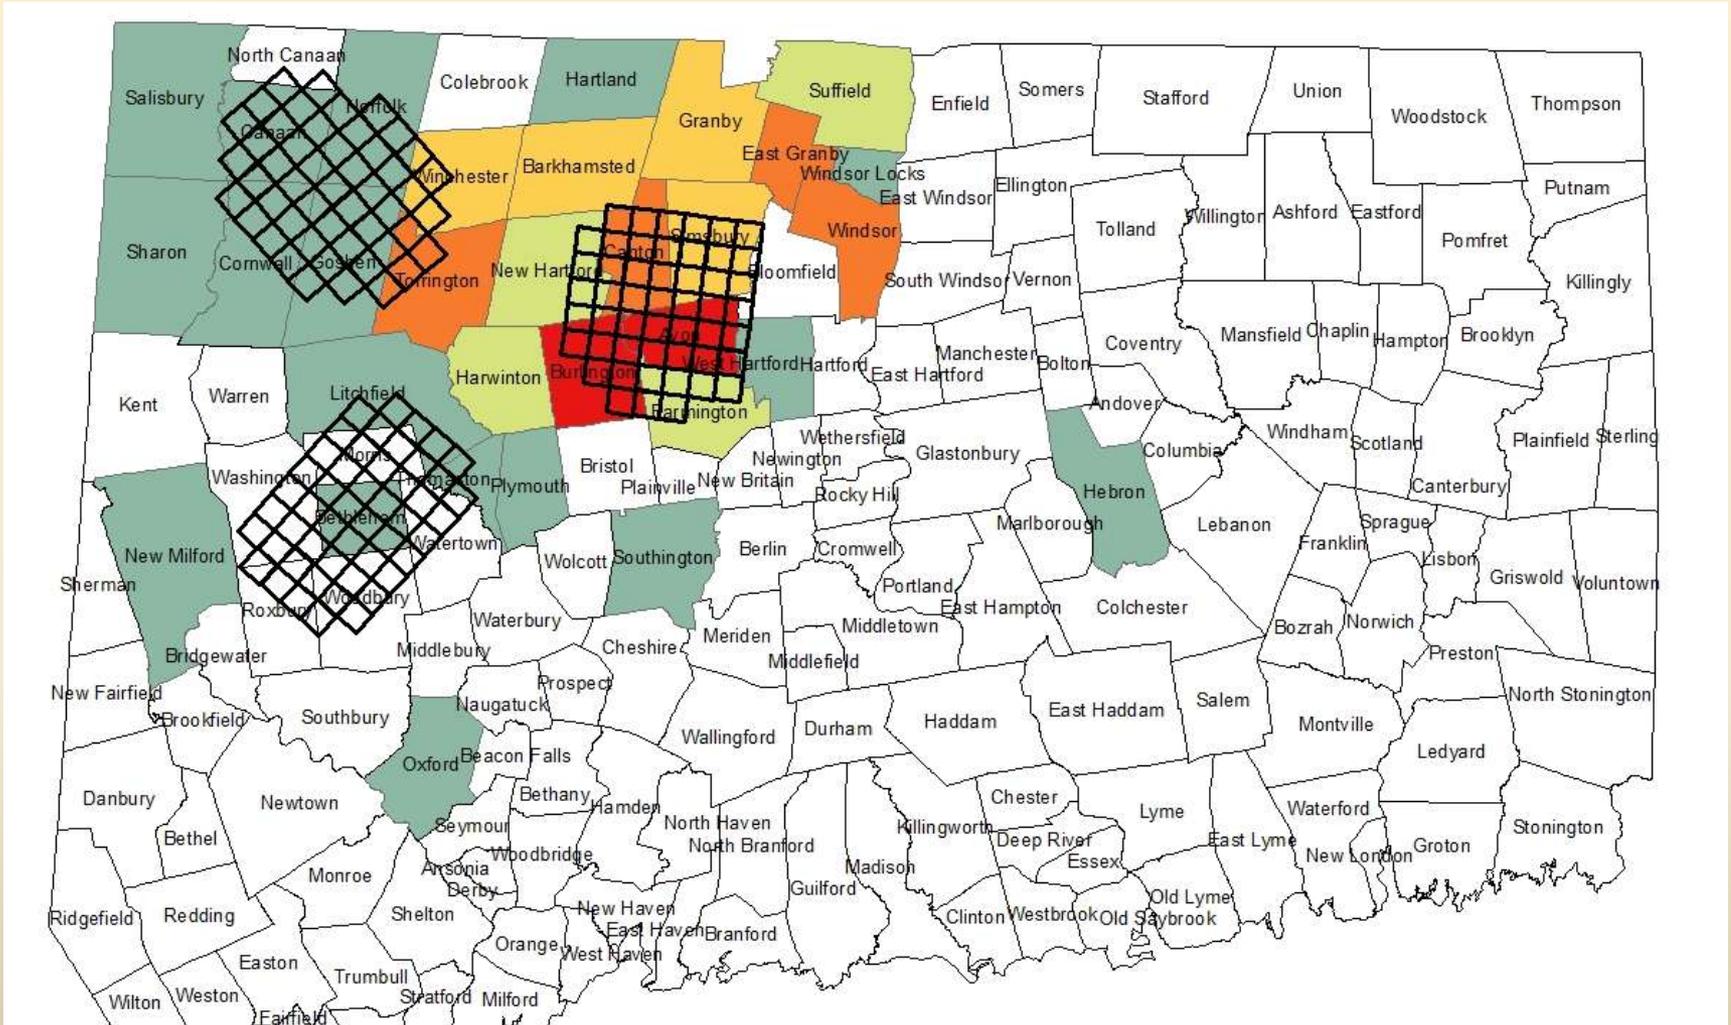

# Study Design: Sampling Grids

IDEAL: 3-4 sampling locations per female summer home range

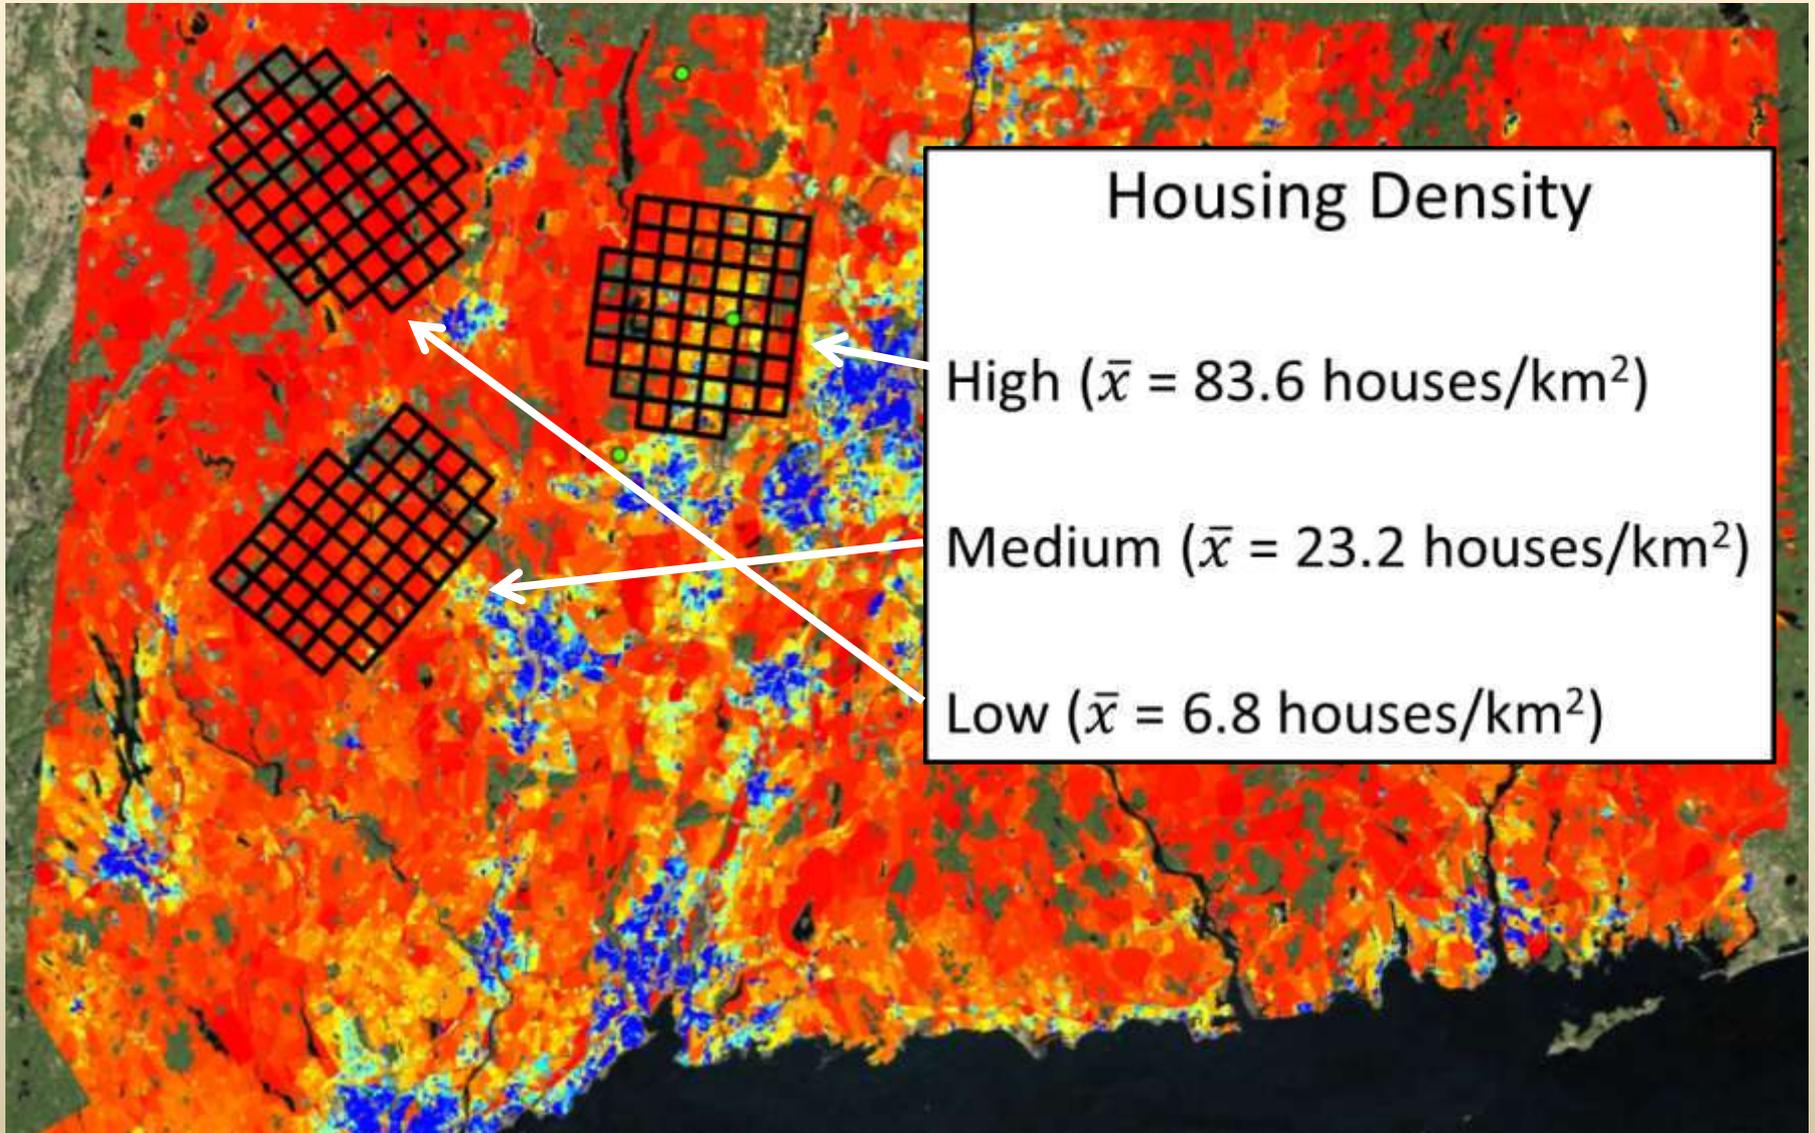

# Study Design: Grid Distribution

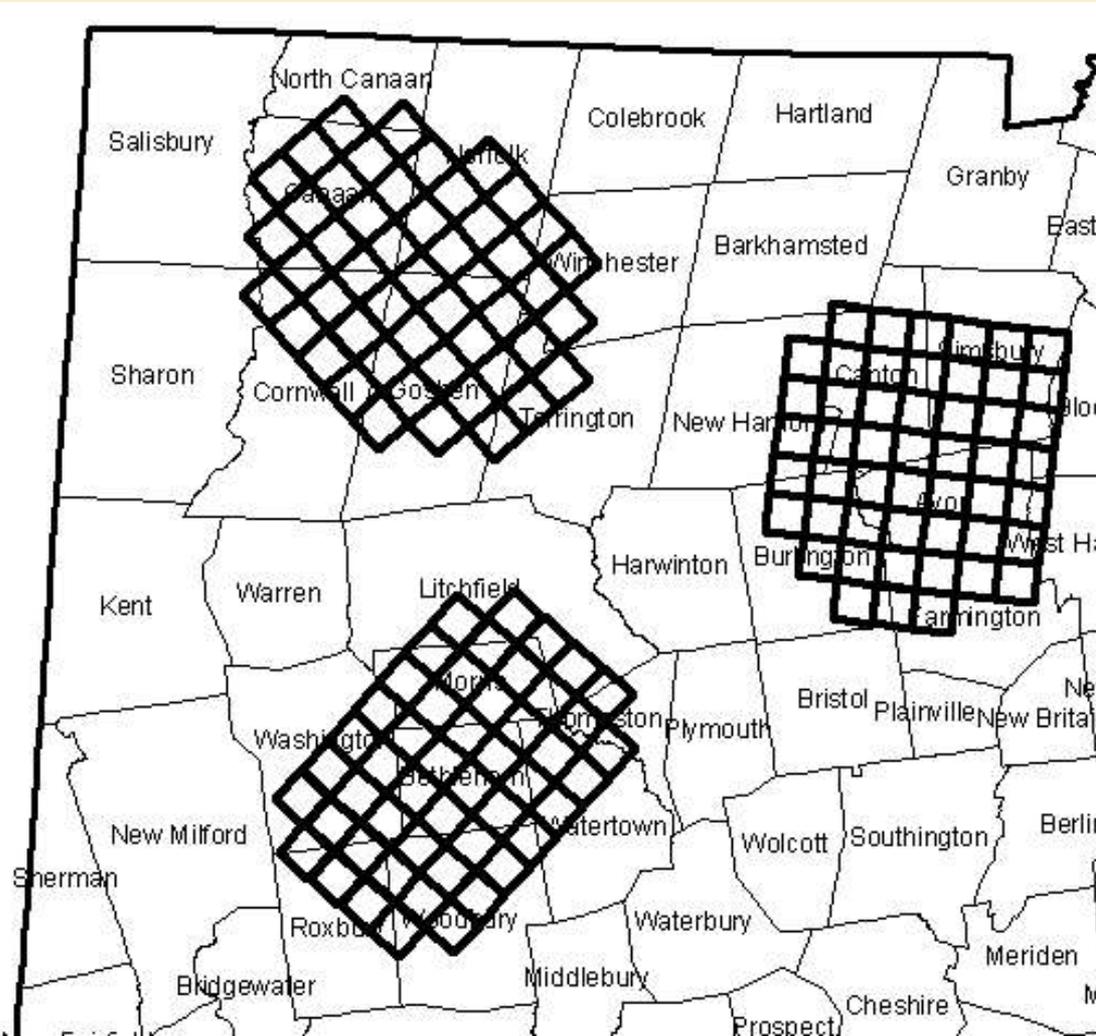

## Cub Sightings (2011)

# Study Design: Grid Distribution

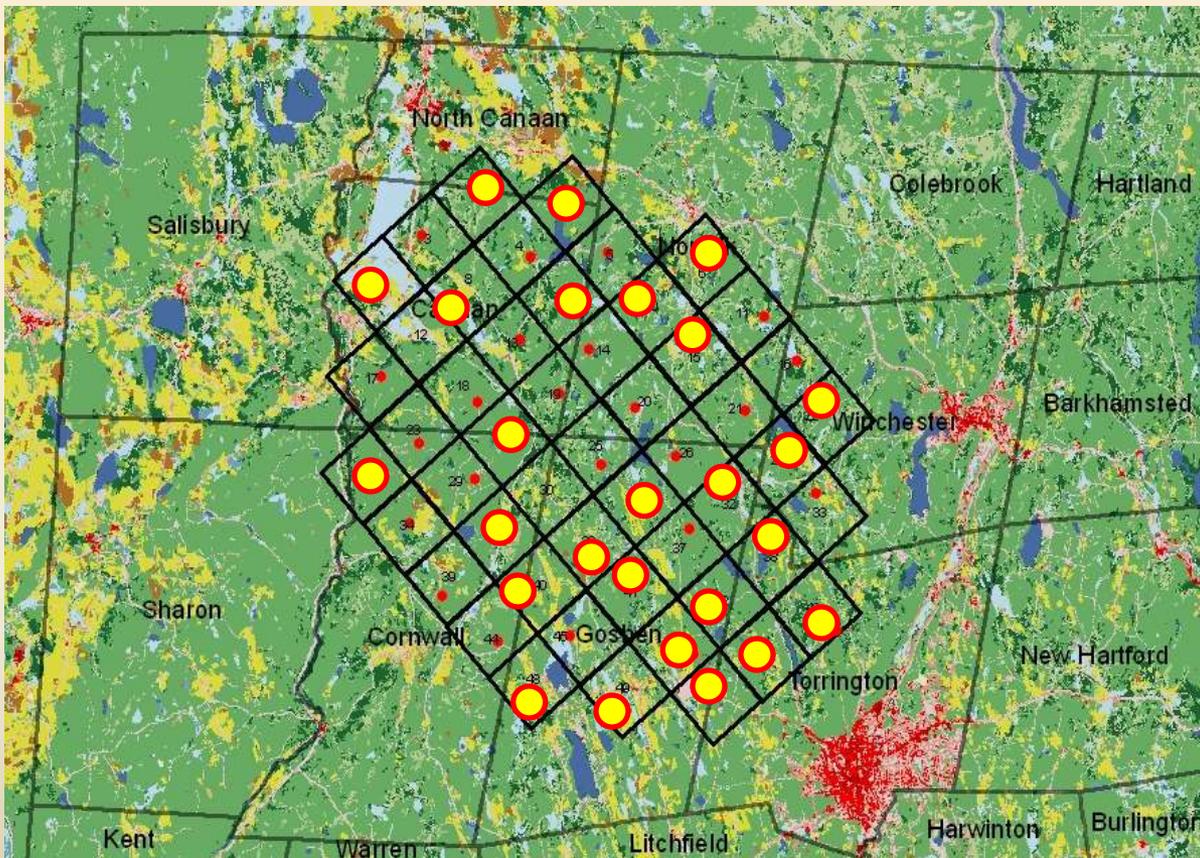

# Study Design: Grid Distribution

- 150 'Hair Corrals'
- ~2.5km Spacing
- Checked weekly  
June through  
August
- 50 wildlife cameras  
(North grid)

# Hair Sampling: 2012

Collected Samples: July to September

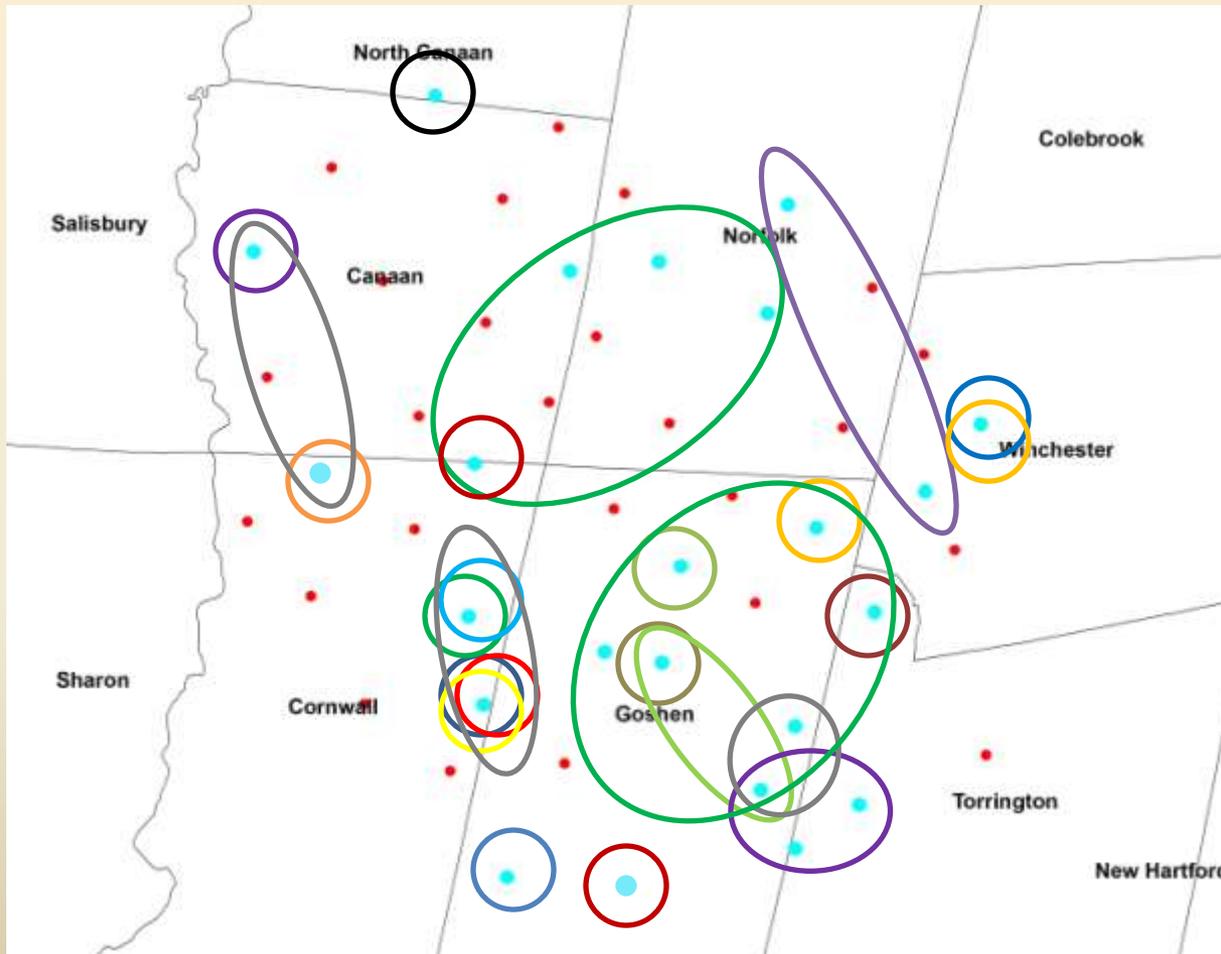

72 Bear Samples

26 of 48 Sites

# Hair Sampling 2012

26 Unique  
Individuals Identified

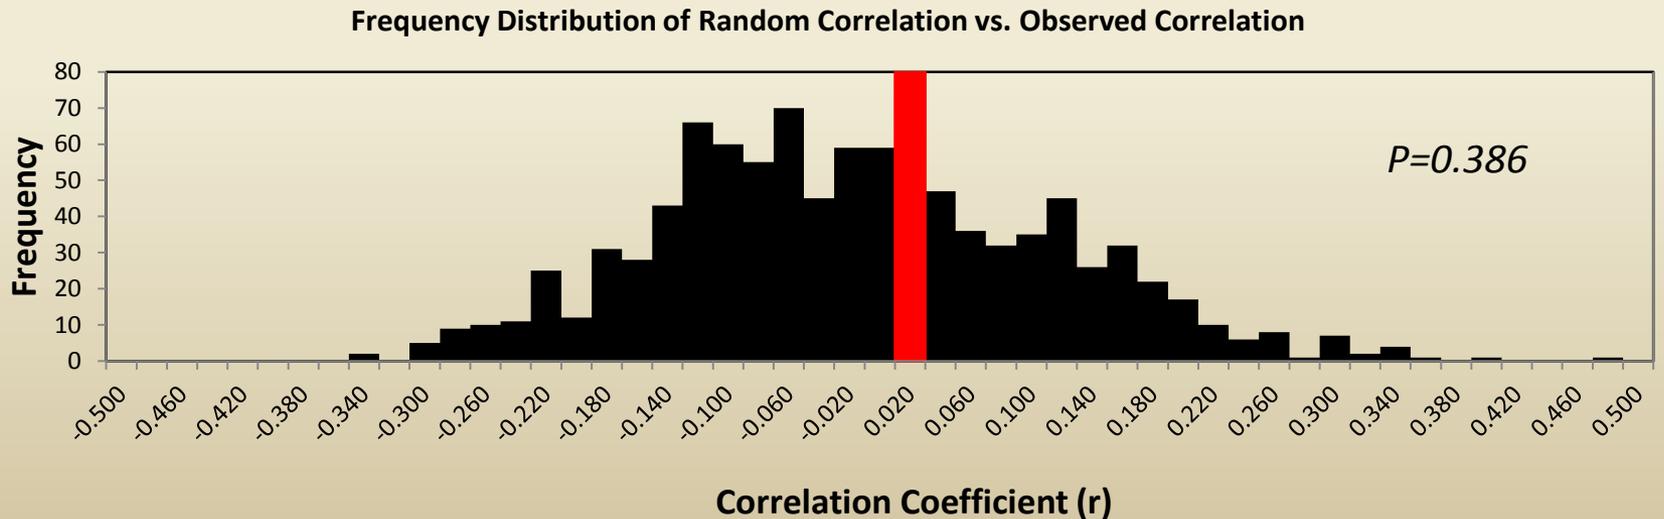

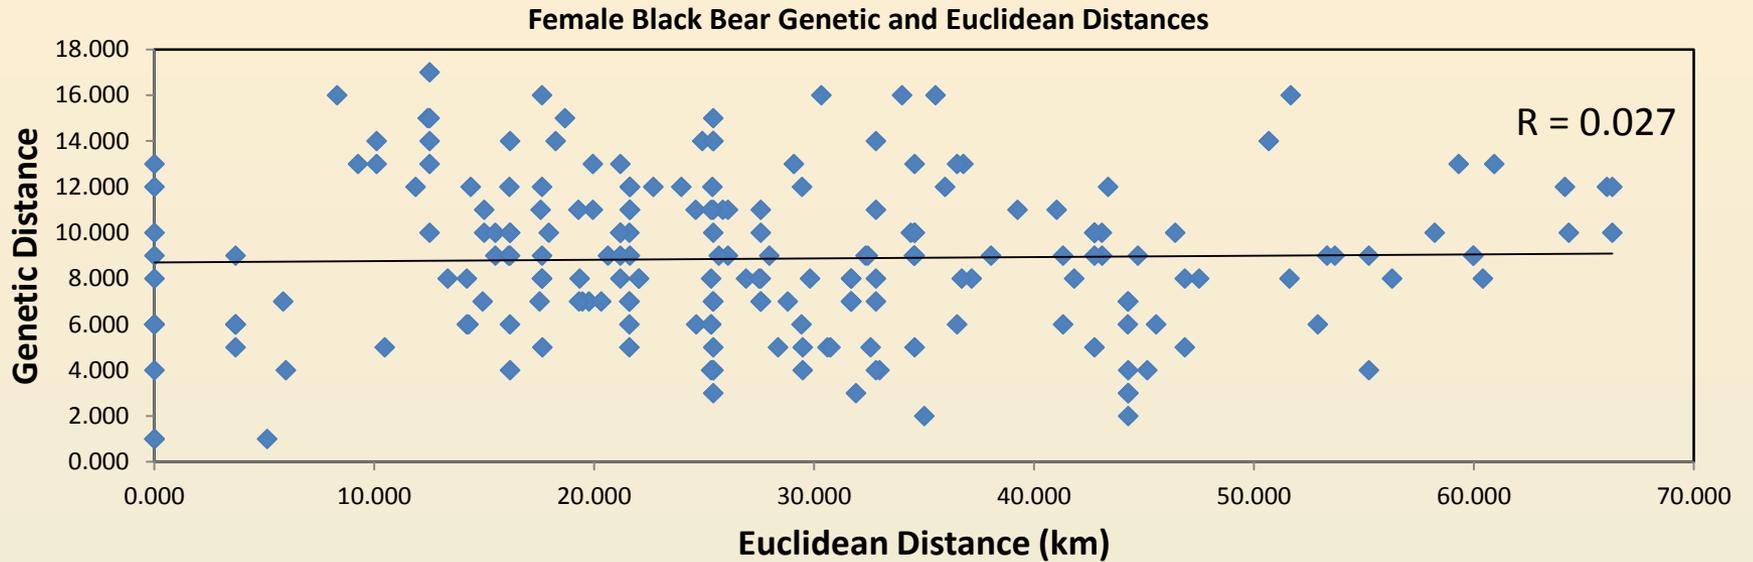

$$N = 42 \pm 8.7$$

$$P_{ID} = 1.9 \times 10^{-4}$$

$$p = 15.6\%$$

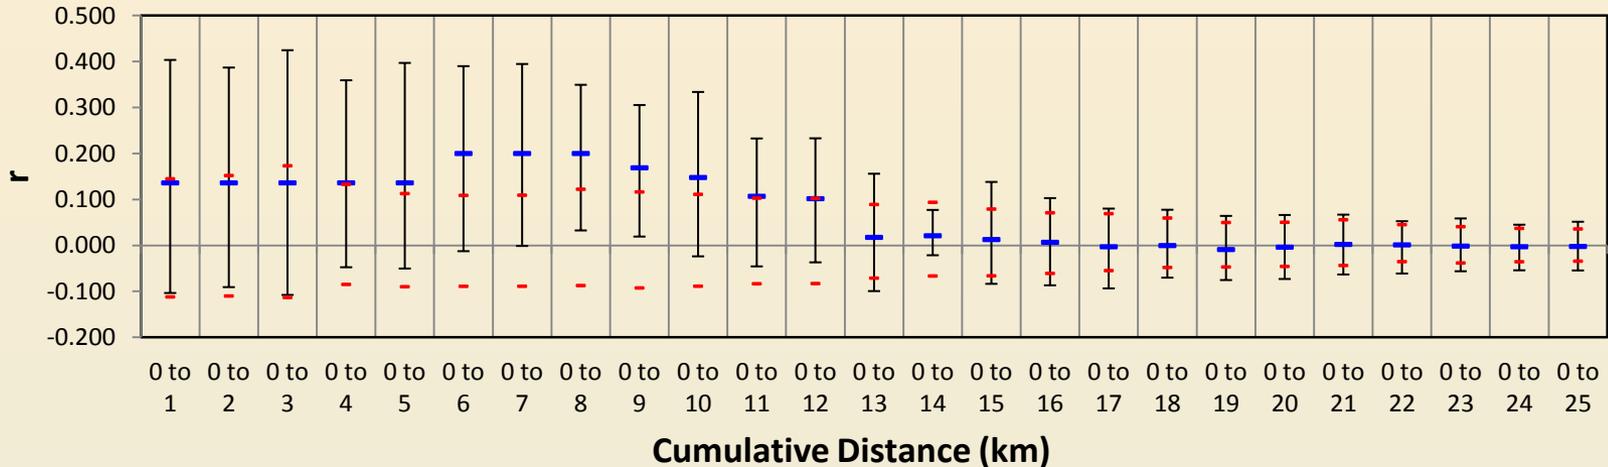

4:1 Female to Male  
Ratio

# Isolation by Distance (Mantel Test)

# Spatial Genetic Clustering

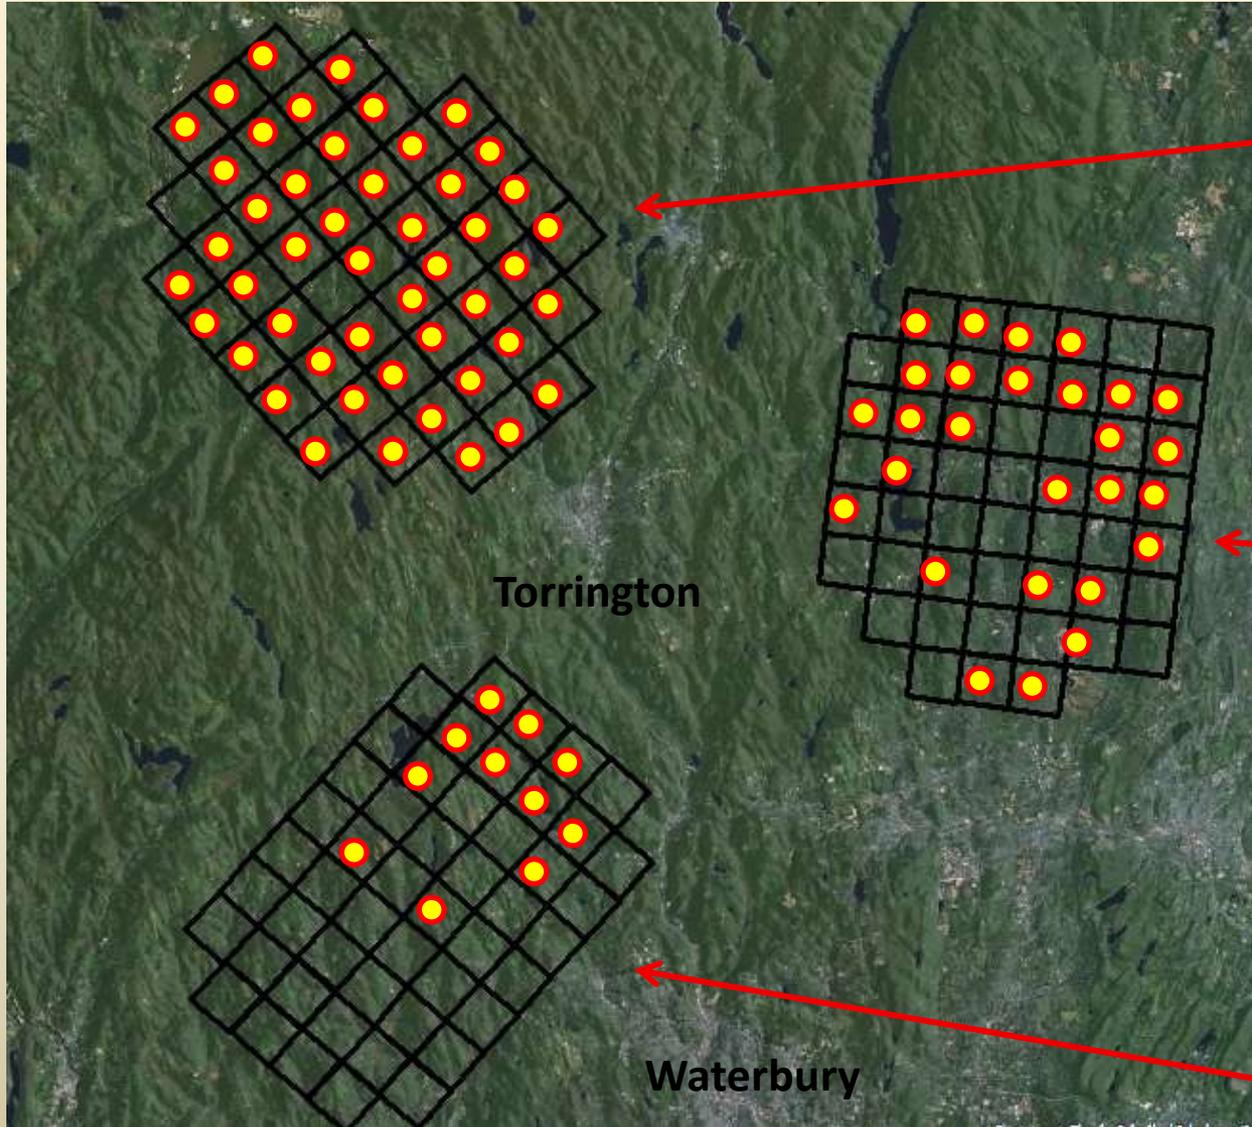

Pairwise Relatedness at Multiple Distance Class Sizes

- Indication of spatial extent at which individuals are more closely related than random
- Individuals within 10 km closely related

# Hair Sampling: 2013

June 1<sup>st</sup> to August 29<sup>th</sup>

405 Bear Samples

North Grid – 48/49 sites

East Grid – 27/48 sites

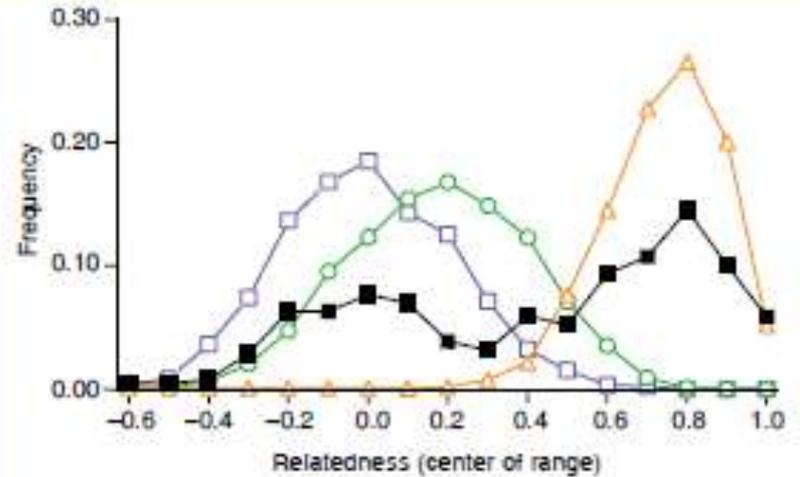

South Grid – 11/50 sites

Table I. Identity by descent coefficients ( $k_0$ ,  $k_1$ ,  $k_2$ ) and relatedness,  $r$ , for some common relationship categories

Relationship category	$k_0$	$k_1$	$k_2$	$r$
Monozygotic twins or self	0	0	1	1
Parent-offspring	0	1	0	0.50
Full sibs	0.25	0.50	0.25	0.50
2° (e.g. half sibs, avuncular)	0.50	0.50	0	0.25
3° (e.g. first cousins)	0.75	0.25	0	0.125
Unrelated	1	0	0	0

TRENDS in Ecology & Evolution

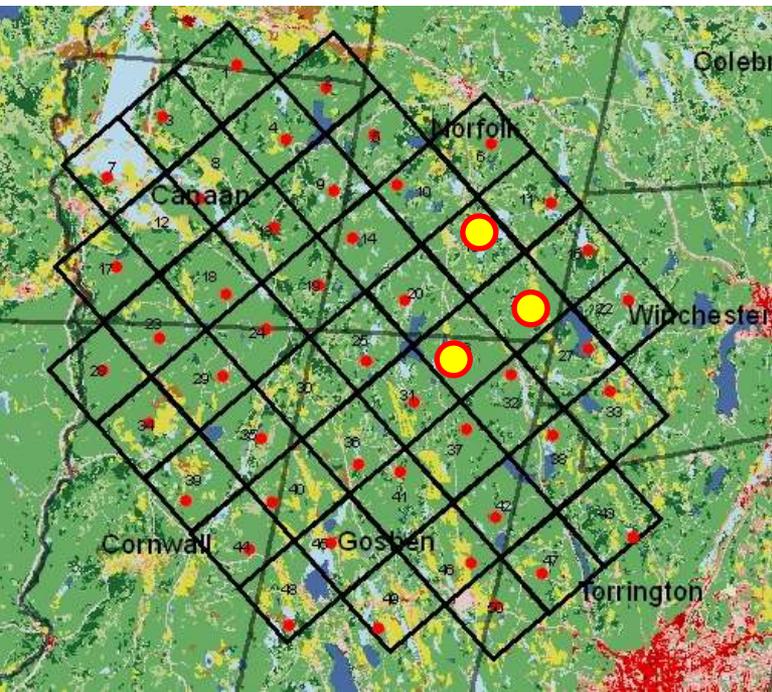

Fig. 1. Observed distribution of pairwise  $r$  estimates among *Polistes dominulus* foundresses (filled squares) and expected distributions for three other plausible relationship categories (open symbols). Values are grouped into intervals of width 0.1. The expected distributions were obtained via simulation. Open squares = unrelated (true  $r = 0$ ), open circles = cousins (true  $r = 3/16$ ), open triangles = full sisters (true  $r = 3/4$ ). True  $r$  values for cousins and sisters are higher than shown in Box 1 because wasps are haplodiploid. Reproduced, with permission, from [34].

# Research Questions

1. Does bear density differ between levels of human development?
2. Is bear dispersal affected by human landscape?
3. Does bear diet differ between human densities?

Questions?

# Isotope Ratios

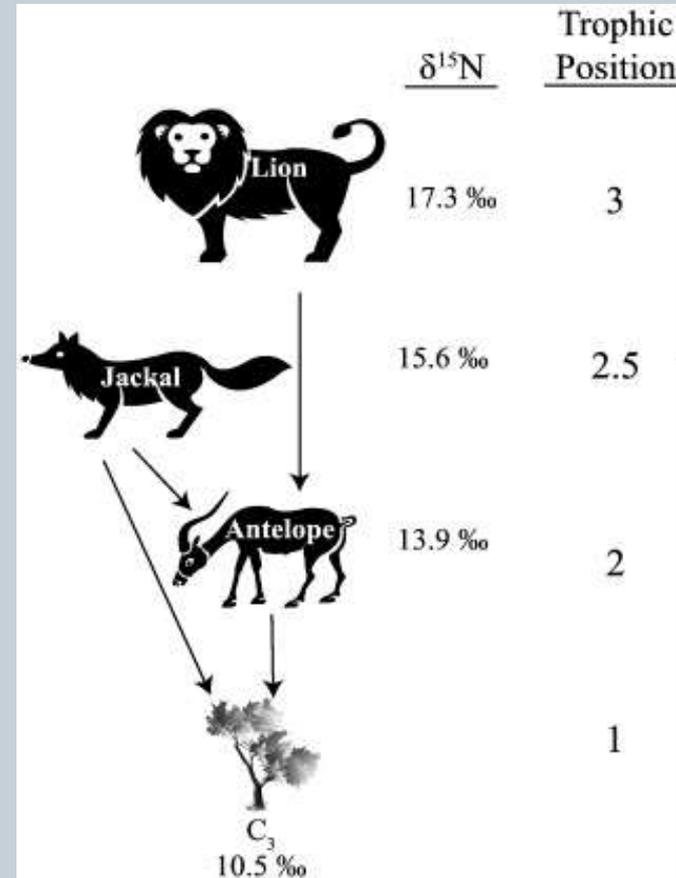

- Atmospheric CO<sub>2</sub> -  $\delta^{13}\text{C} = -8$
- Atmospheric N<sub>2</sub> -  $\delta^{15}\text{N} = 0$
- Ratios change during chemical bonding
  - Fractionation
  - Mixing

<b><sup>12</sup>C</b> 12.00000 98.89%	<b><sup>13</sup>C</b> 13.00335 1.11%
Stable	Stable
<b><sup>14</sup>N</b> 14.00307 99.63%	<b><sup>15</sup>N</b> 15.0001 0.37%
Stable	Stable

# Changes in $\delta^{15}\text{N}$

- $\delta^{15}\text{N}$  increases with trophic level
- Preferential elimination of  $^{14}\text{N}$  in waste during de-aminification

# Changes in $\delta^{13}\text{C}$

## $\text{C}_3$ Plants

- Highly selective against  $^{13}\text{C}$
- $\delta^{13}\text{C} \sim -28$
- Predominant plants in temperate climates

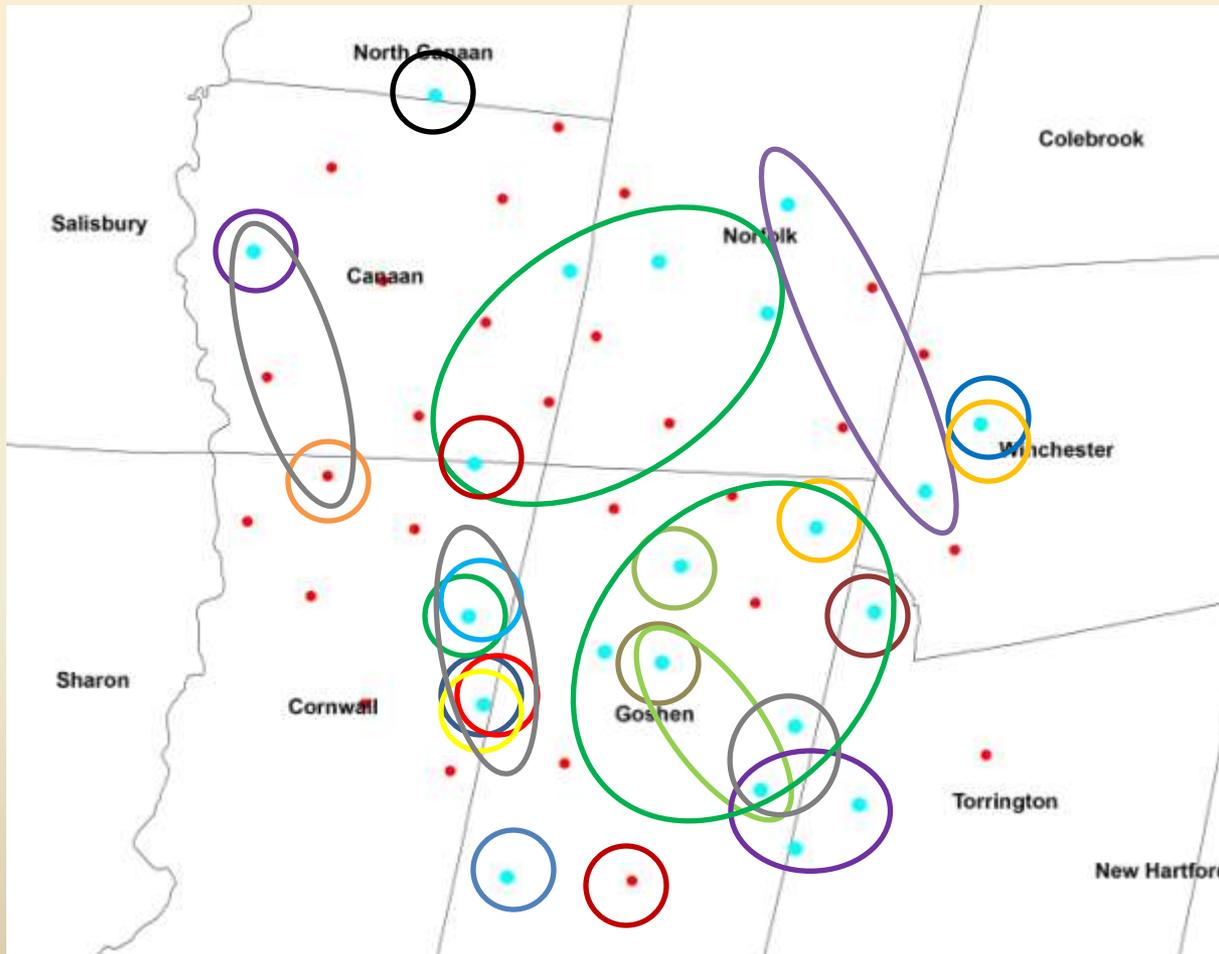

## $\text{C}_4$ Plants

- More readily incorporate  $^{13}\text{C}$
- $\delta^{13}\text{C} \sim -12$
- Tropical plants, CORN & SUGAR CANE

# Population Estimation 2012

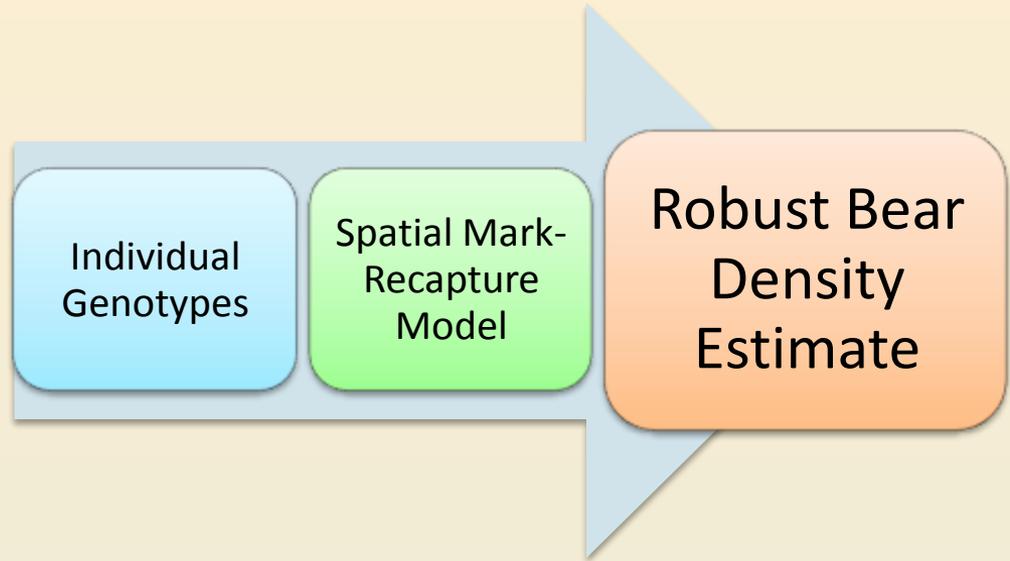

26 Individuals Identified

$$N = 42 \pm 8.7$$

$$P_{ID} = 1.9 \times 10^{-4}$$

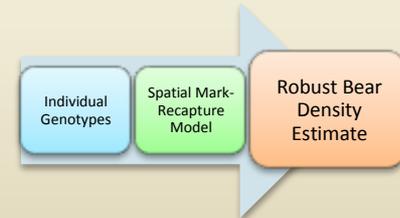

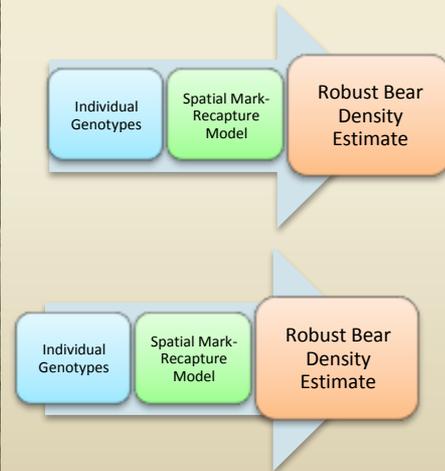

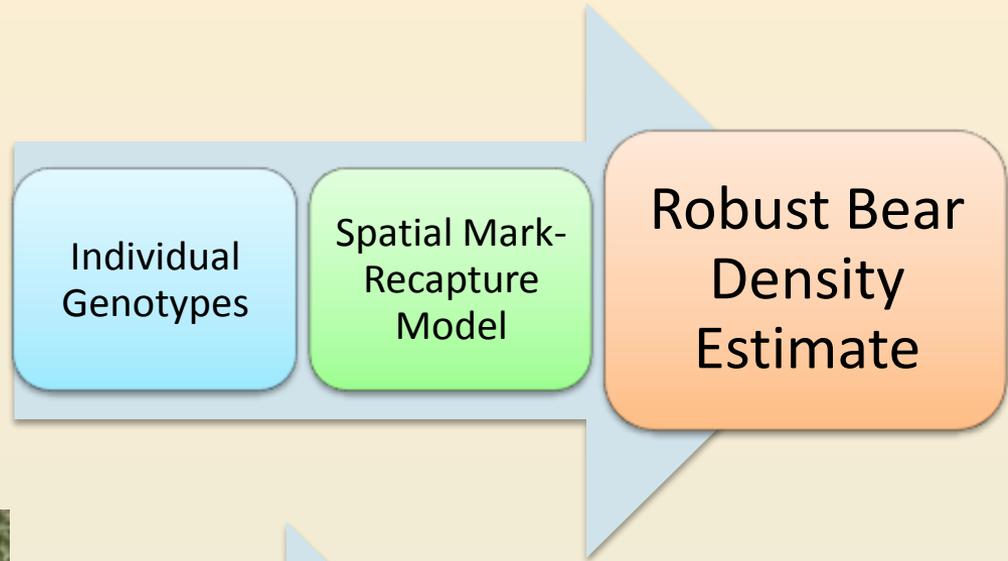

$$p = 15.6\%$$

# Population Estimation 2013 & 2014

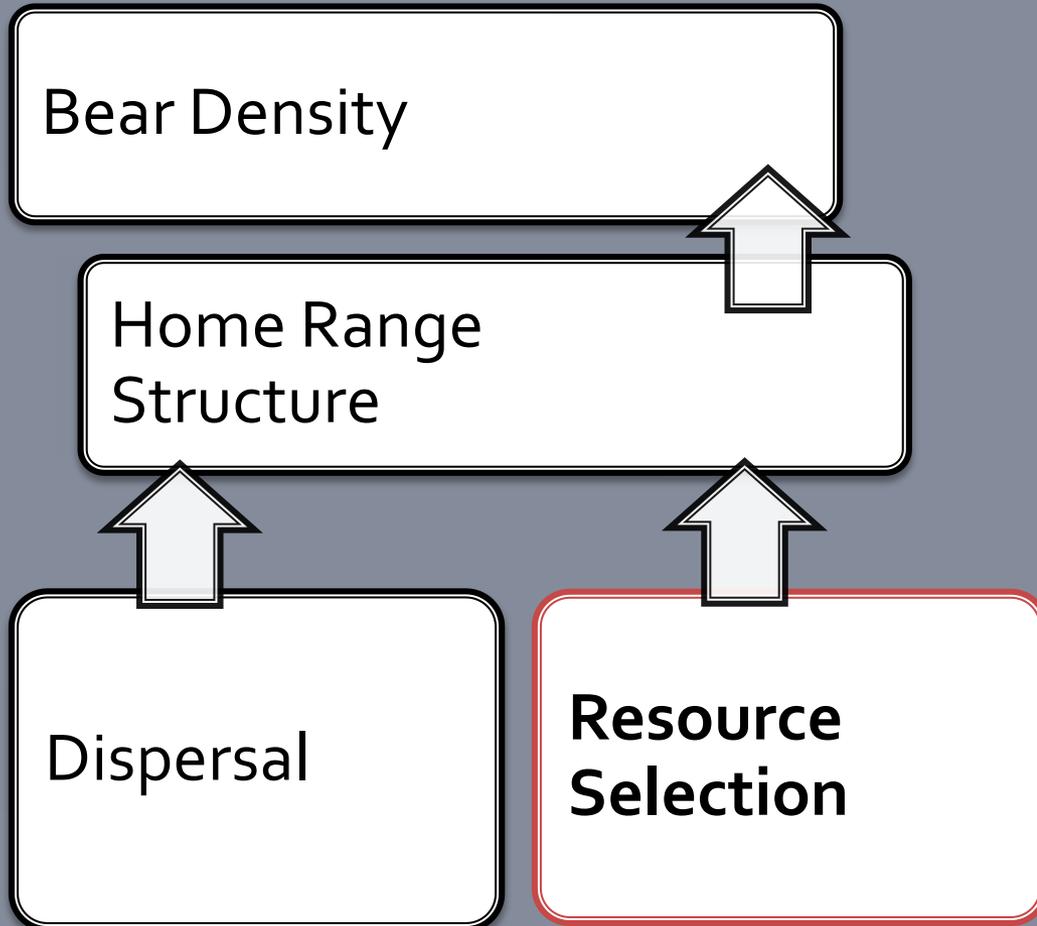

**Question: How Does Human Density Affect Bear Density?**

# Population Estimation 2013 & 2014

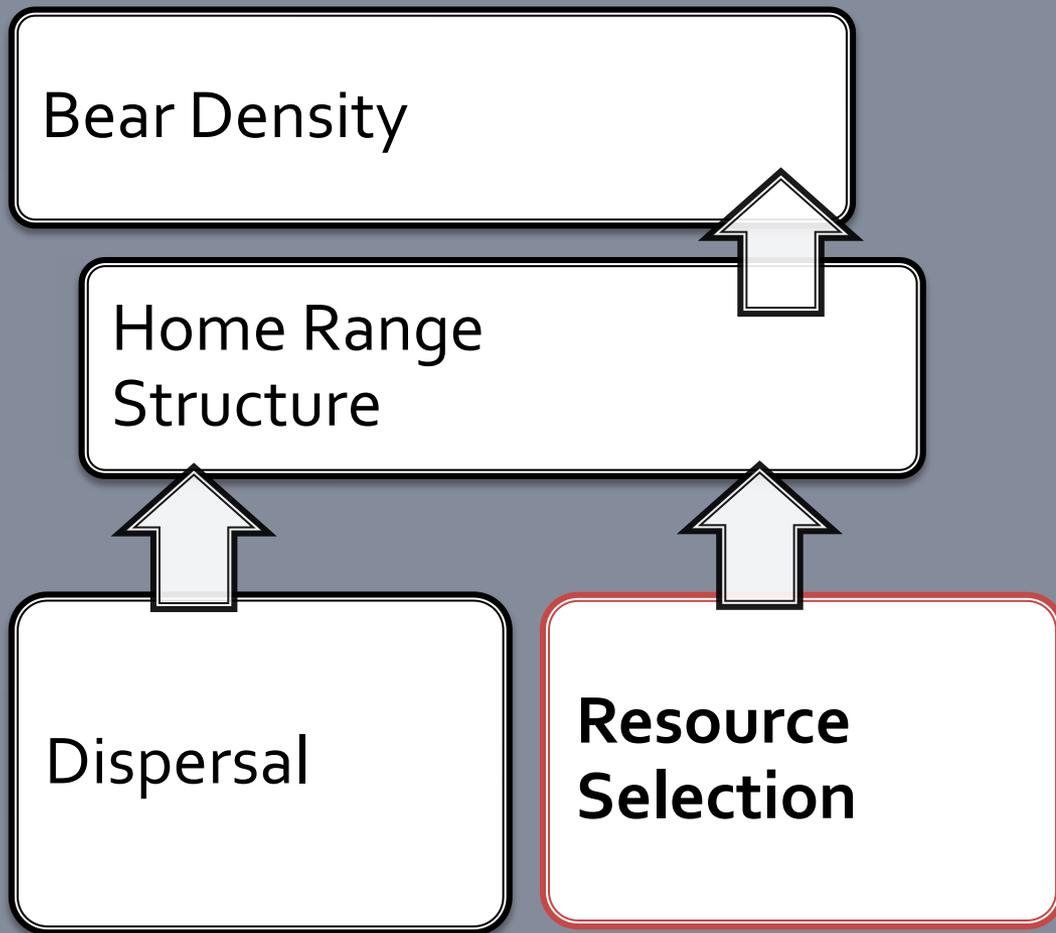

# Link Pattern to Process

Q: Differences in Bear Diet Composition According to Human Density?

# Link Pattern to Process

Q: Do Bears Select Resources/Habitat Differently According to Human Density?

# GPS Collars

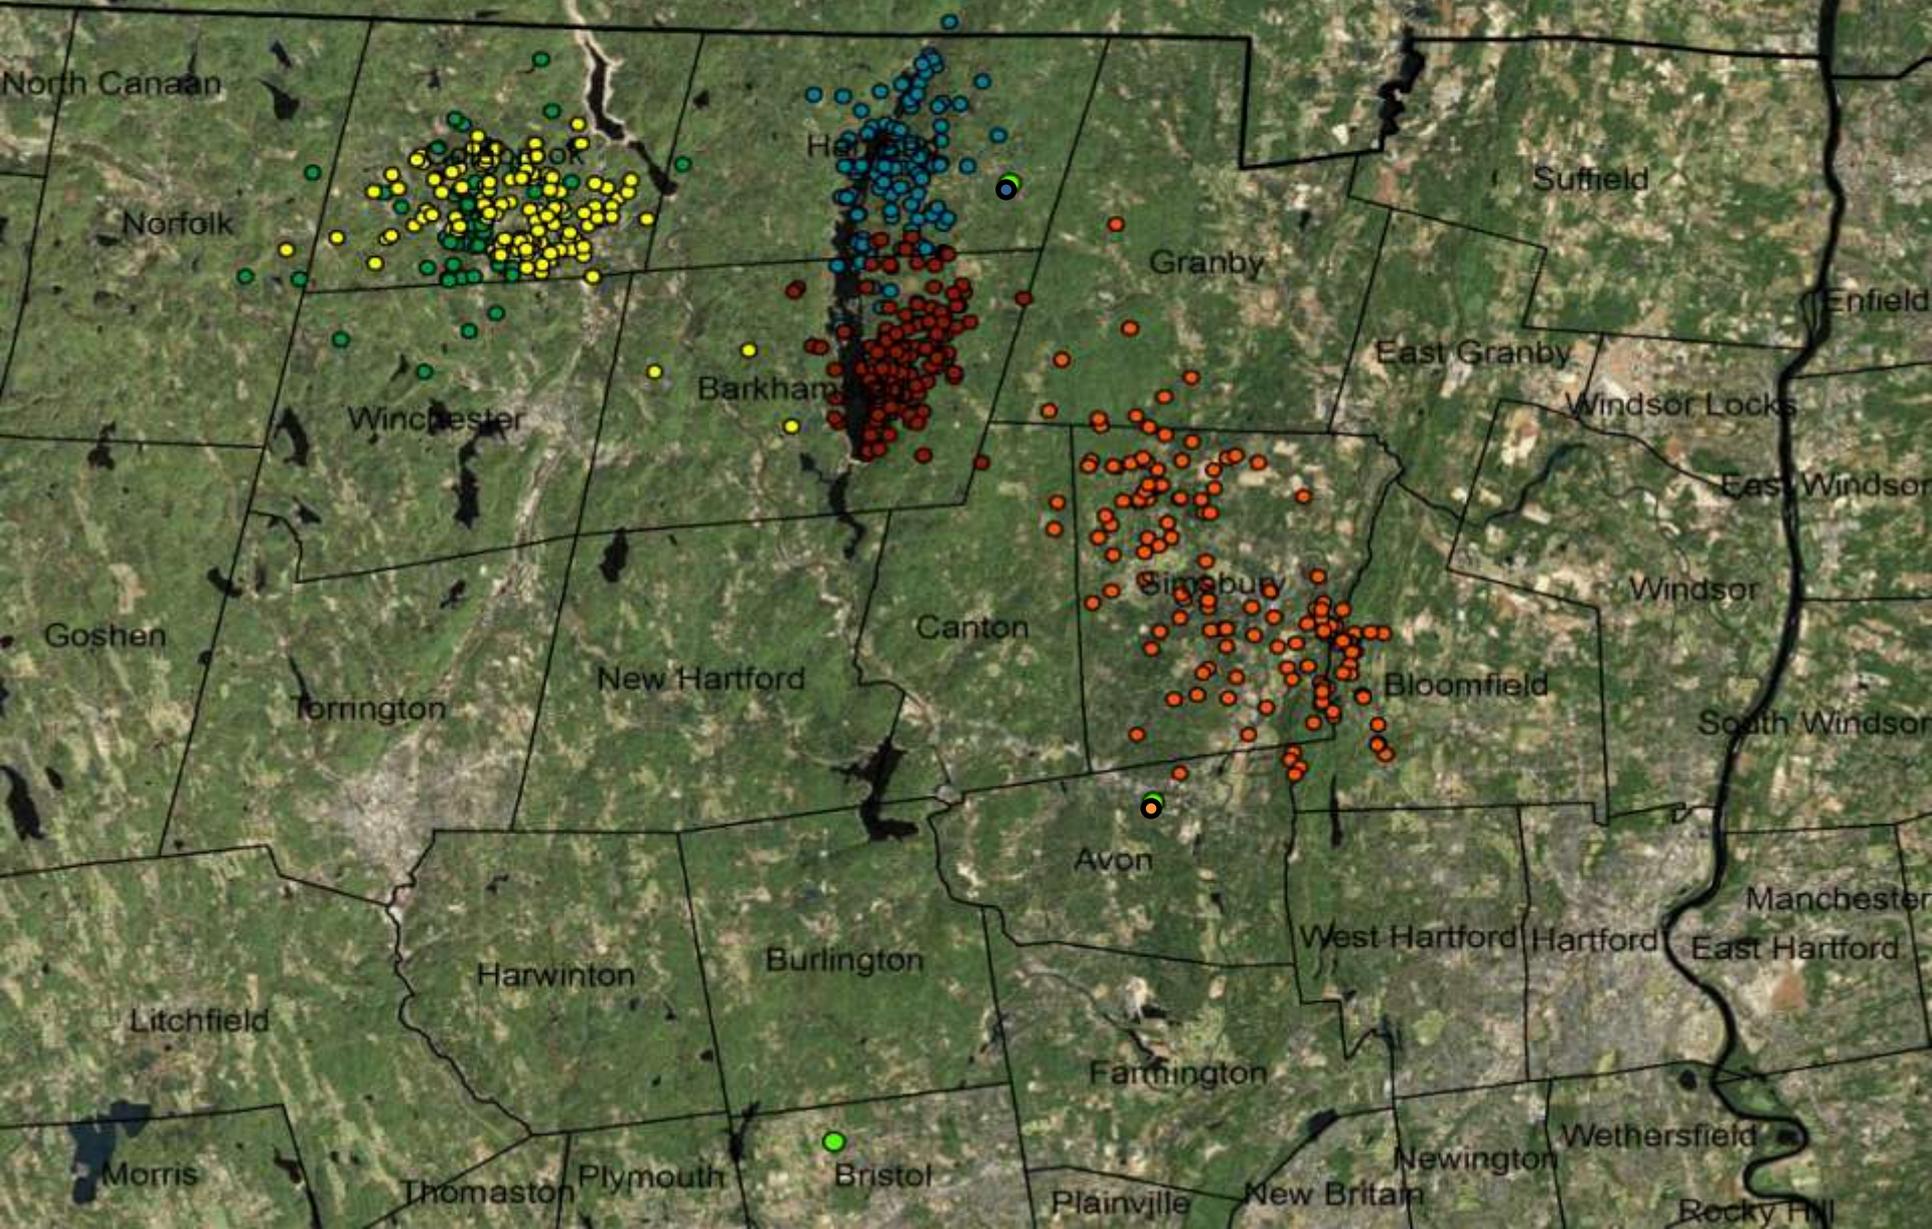

- ~ 20 collars on female bears in western CT
- Take a position once per hour
- Store information on location and movements from spring to winter

Photo credit: Connecticut Department of Energy and Environmental Conservation

# GPS Collar Data

# Link Pattern to Process

Bear Density

Home Range  
Structure

**Resource  
Selection**

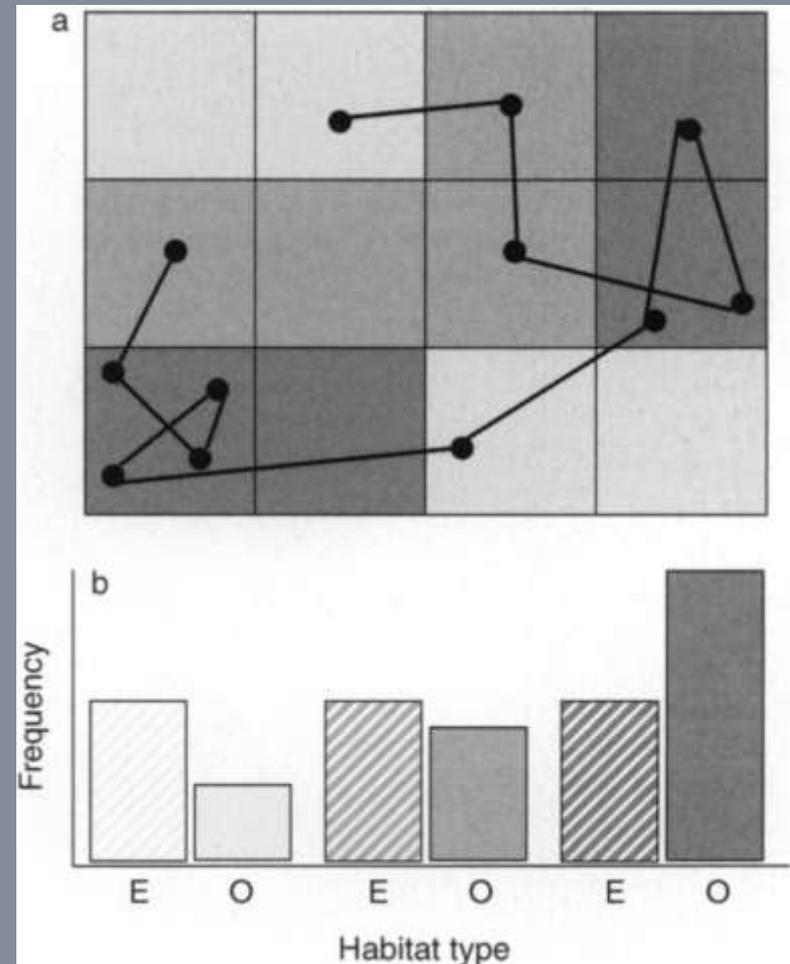

Q: How are bears  
using human  
modified  
landscapes?

# Resource Selection Analysis

1. Quantify variables of interest at used locations
2. Compare use to availability – Higher or Lower than expected?

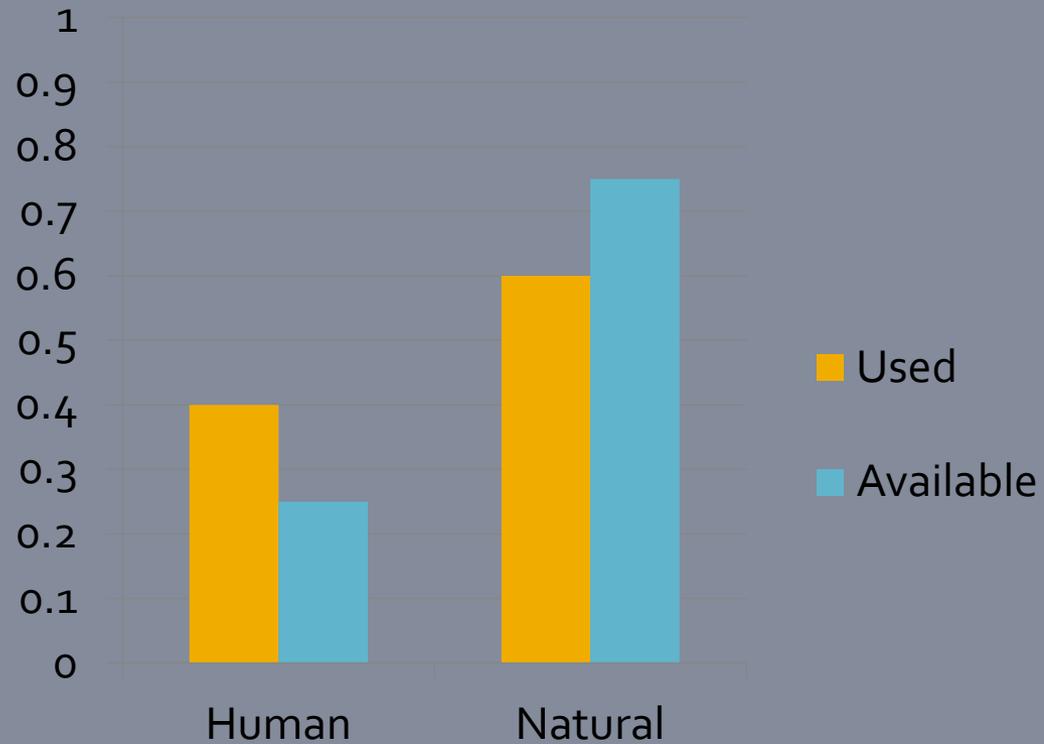

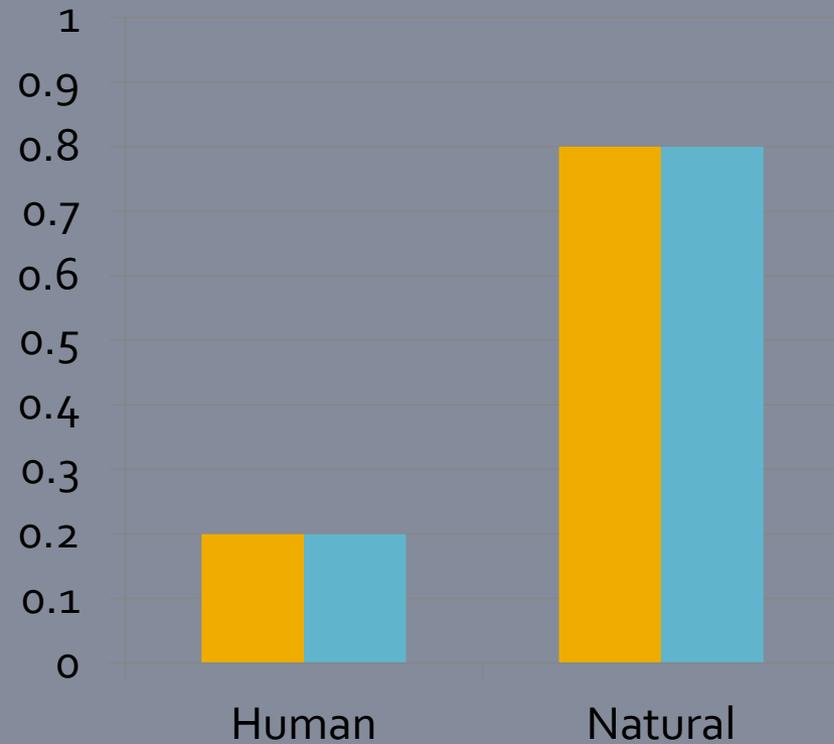

From Moorcroft and Barnett (2008)

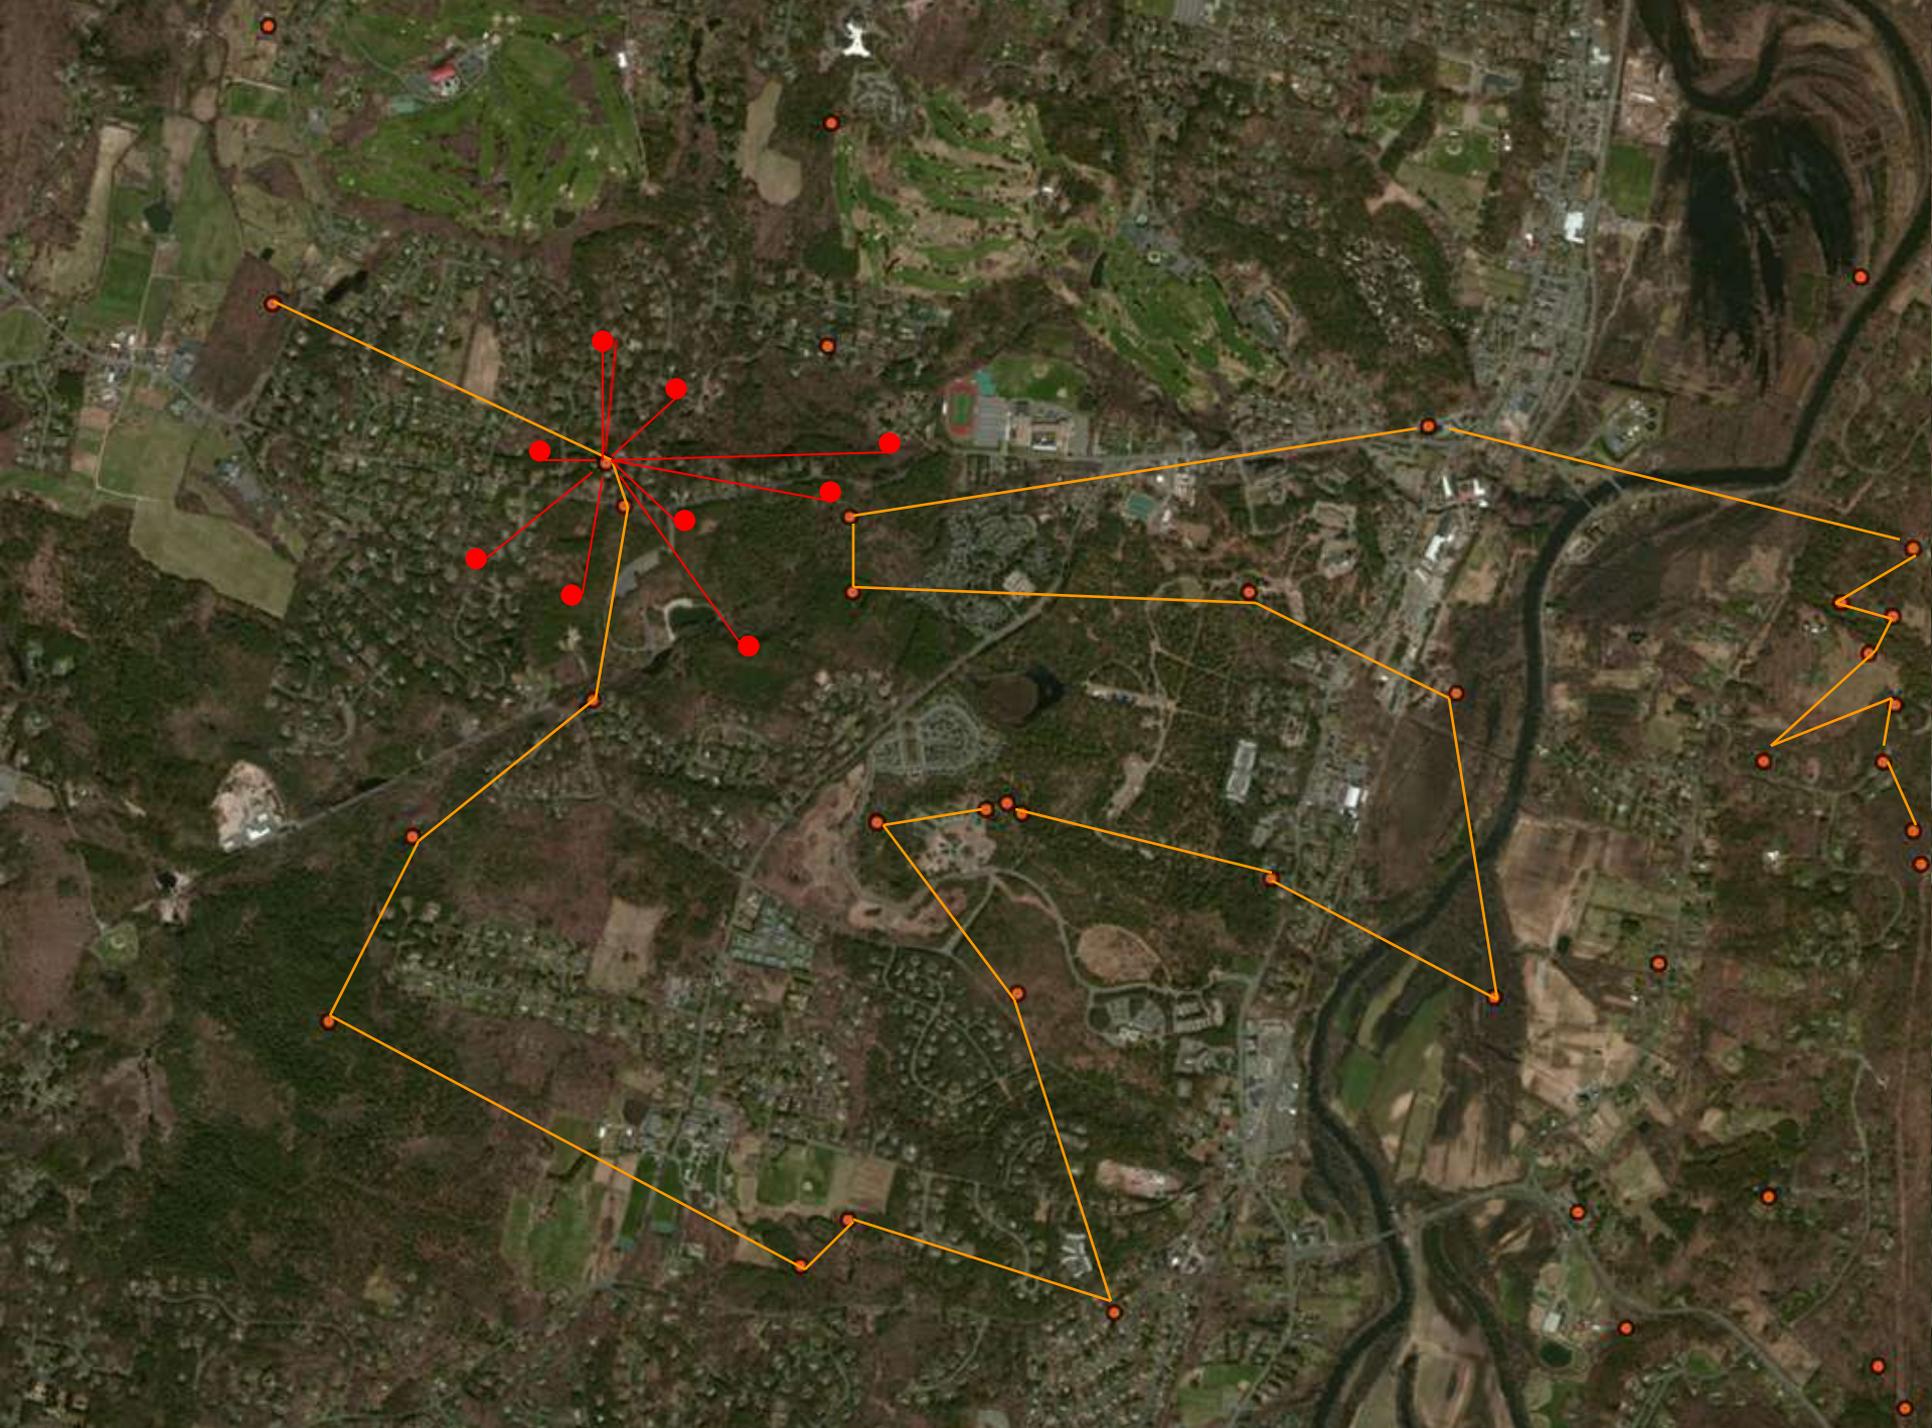

# Resource Selection Analysis

## Low Human Density

## High Human Density

Q: Does Resource Selection Change in High and Low Human Density Areas?

# Step Selection Analysis

- Model movement likelihoods given available resources at each GPS relocation
- Produce probabilities of resource attraction/avoidance – incorporate into home range models
- Selection is dependent on current location

Q: Do Bears Select or Avoid Anthropogenic Resources (Homes/Roads)? Is Selection Affected By Level of Development/Surrounding Environment?

# Link Pattern to Process

Bear Density

Home Range  
Structure

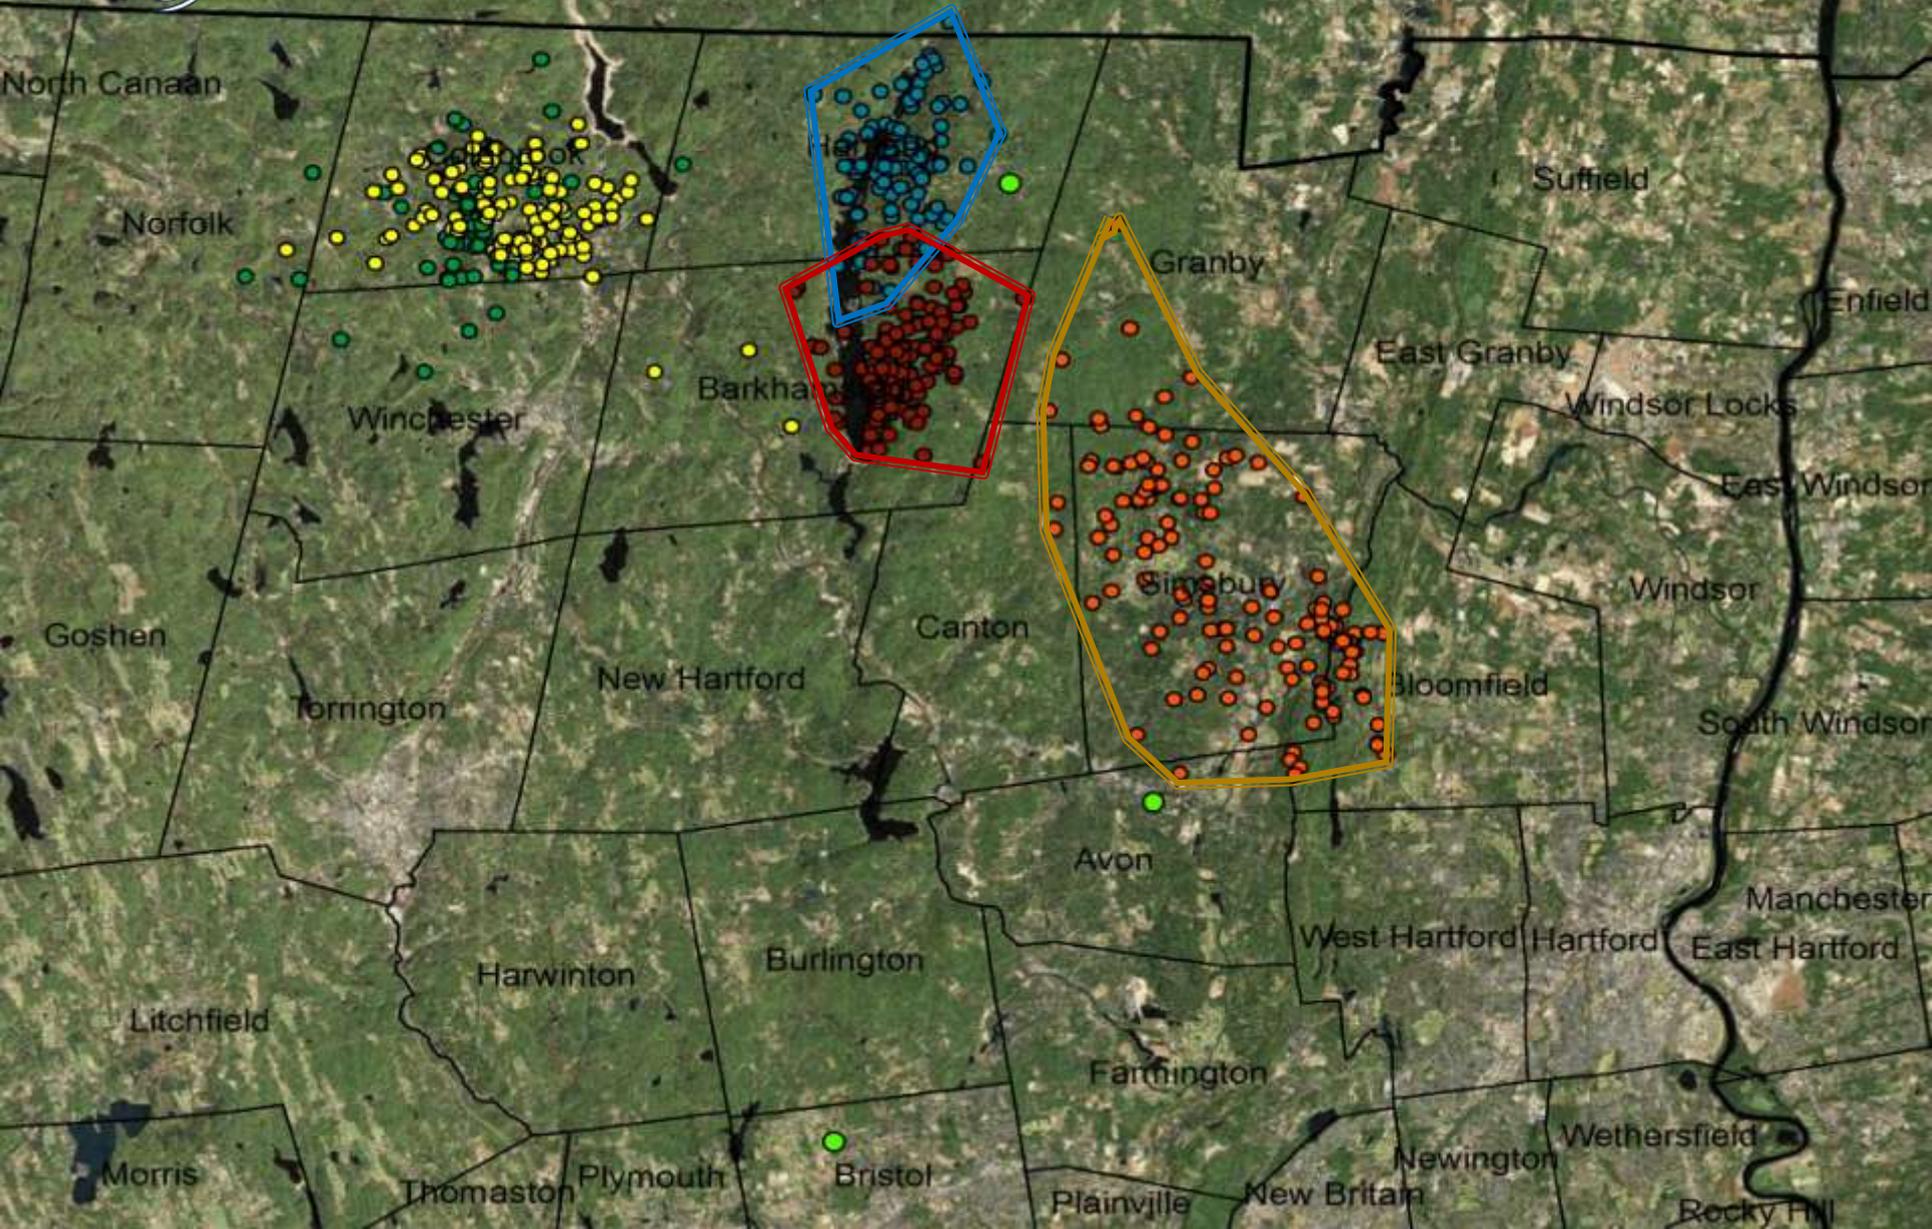

Resource  
Selection

Q: Does Home  
Range Size/Overlap  
Differ According to  
Human Density?

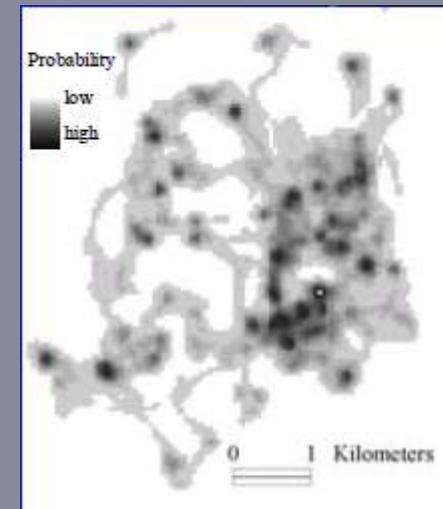

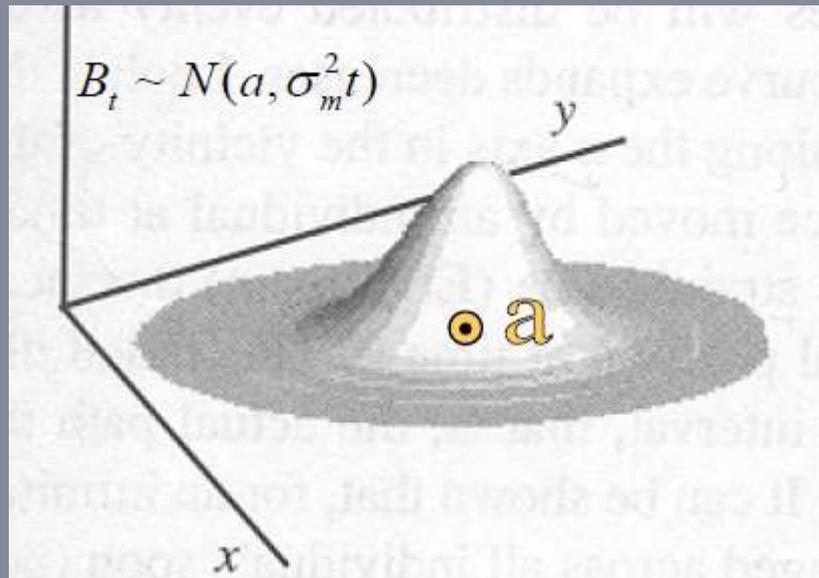

# GPS Collar Data

# Mechanistic Home Range Estimation

- Identify Predictors
- Test ecological hypotheses

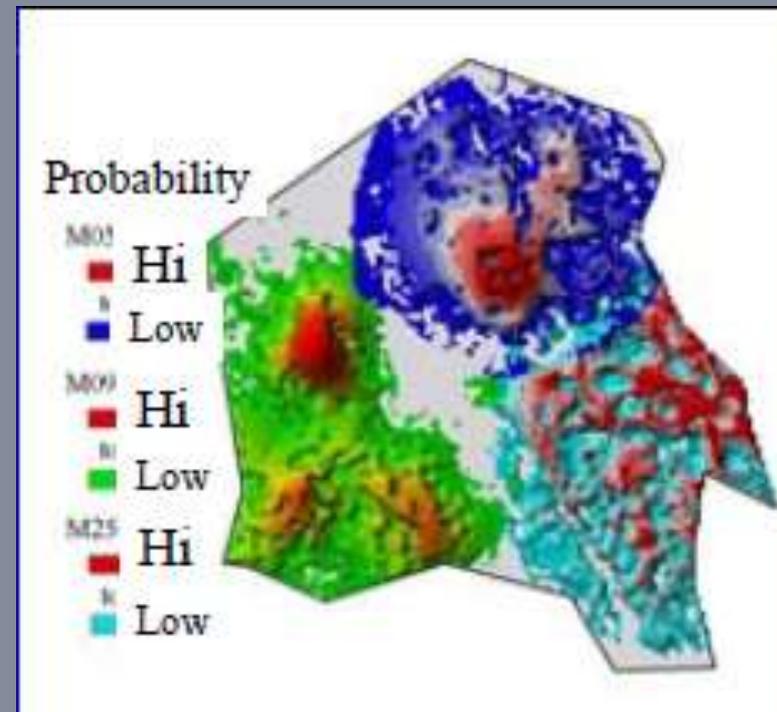

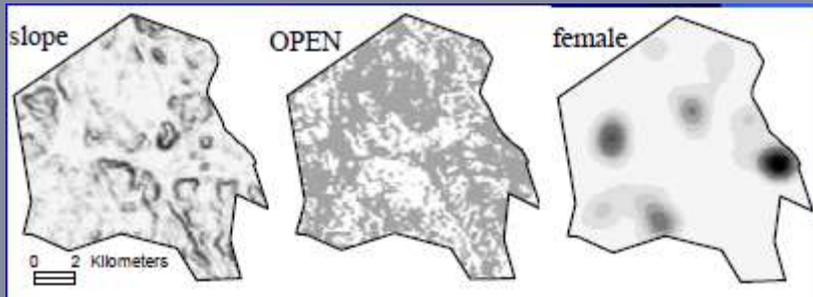

$$f_u(x) = \frac{f_a(x) \exp(\beta' H(x))}{\int_x f_a(x) \exp(\beta' H(x))}$$

# Mechanistic Home Range Estimation

	Parameter Estimate ( $\beta$ )		
Male ID	Female Density	Percent Slope	OPEN
M05	8.77	-0.99	2.00
M09	47.58	-0.53	1.36
M25	1.48	-0.98	0.66

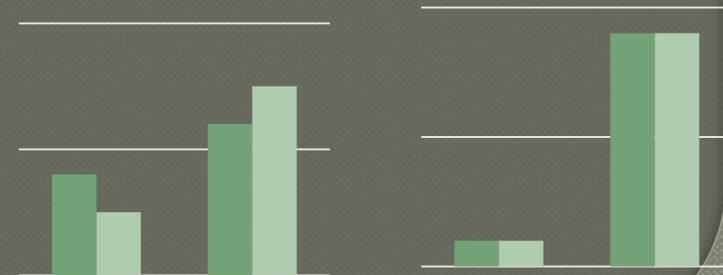

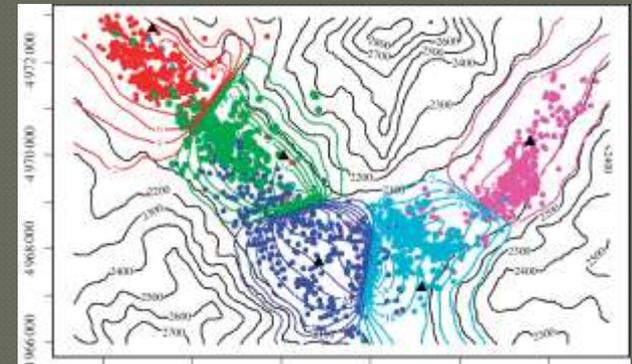

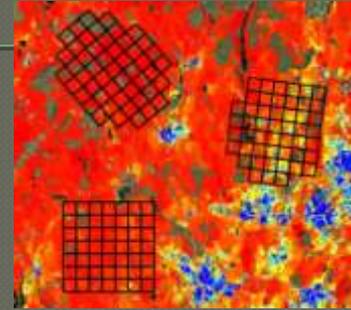

# Home Range Estimation

1. Female Bears Structure Home Ranges to Avoid Conspecifics
2. Female Bears Structure Home Ranges to Include Minimum Area of Forest
3. Female Bears Structure Home Ranges to Exclude Human Development
4. Compare btwn 'Suburban' and 'Rural' Bears

**Answers Where and WHY bears  
are likely to occur**

# Summary

- Describe relationship between human and bear density
- Associate these patterns with underlying processes using GPS data
- Quantify how human landscape modification affects those processes

# Questions?

# Home Range Model

Q: Does Home Range Size & Overlap Differ According to Human Density?

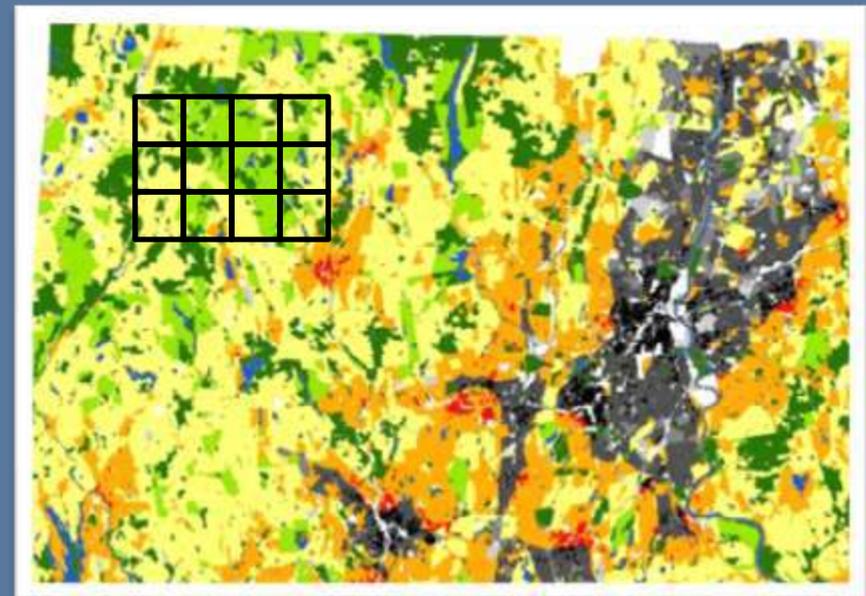

Q: Does Human Development Affect Home Range Structure?

Q: How Will Home Ranges Be Structured as Bears Expand in CT?

# Hair Collection: 2012

## Determining Corral Distribution:

1. Areas with bears
2. Low human density
3. Contiguous habitat
4. 2-3 corrals per female home-range

# Population Estimation: Genetic Mark Re-Capture

# Population Estimation: Genetic Mark Re-Capture

$$\frac{\text{Number marked in second sample}}{\text{Total caught in second sample}} = \frac{\text{Number marked in first sample}}{\text{Size of whole population (N)}}$$

# Population Estimation: Genetic Mark Re-Capture

Unique genetic ID replaces physical mark

1. Obtain DNA from multiple 'sampling' sessions
2. Genotype individuals
3. Encounter History = 'Captures' and 'Re-captures'

**Advantage: Non-Invasive**
